

Entry Test Preparation & Practice Book

A solution to

MDCAT PHYSICS

Features

- Easy and Concise material
- ➤ Short Tricks to solve MCQs
- Urdu Explanation is added for easy understanding
- Key and explanation of MCQs are included

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

Assingur Basur, Faisalaba L.

PREFACE

I, PROF. AZHAR IQBAL, am teaching Physics to the students of MDCAT and F.Sc from the last 12 years. Since long, I have been observing the problems of Students of MDCAT, as well as feeling that for the preparation of MDCAT, there are no such books in the market that can solve the problems of the students. Therefore, in order to solve the problems of the students of MDCAT, I decided to write comprehensive book.

Now, by the grace of Allah, The Almighty, I have successfully written a book for the student of MDCAT. The book contains two portions i.e, MDCAT preparation book and MDCAT practice book. This book is a combination multiple extraordinary qualities that have never been observed in any other book.

- > All the topics have been written in quite an easy way.
- > The book has been written according to prescribed syllabus of MDCAT
- Difficult questions have solved by using short tricks
- > A chapter consisting of short tricks have also been added in the book
- Difficult concepts have also been described in Urdu for the convenience and better comprehension of the students.

I hope this book will be quite helpful in solving the problems of the students of MDCAT. It will lead them to the target learning as well.

I am looking forward for your valuable suggestions and feedback. So that I will make improvements in this effort in my next edition.

Best wishes

Author Prof. AZHAR IQBAL WhatsApp: 0336 709 8894

MIDCAT PREP BOOK

DEDICATION

To

My Beloved Wife,

For her continued unfailing Love, Support and Understanding that made the completion of this book possible.

BASIC TRICKS

Important Tips to Solve Physics MCQ's

1. فز کرکے زیادور MCQ's کا تعلق Formulas کے ساتھ ہو تا ہے اس لئے جب بھی آپ کوئی Topic پڑھیں تواس میں استعال ہونے والے Formulas کو اچھی طرح یاد کریں اور Formulas سے بنے والے مندر جہ ذیل قشم کے سوالات کو ضرور مد نظر رکھیں۔

1. ایک Quantity کی دو بر Quantity کی دو ایک Quantity کی اا جو گا۔

Example:

By increasing the distance from the positive point charge its potential:

- (a) Increases
- (b) Decreases ✓
- (c) remain same
- (d) either increases or decreases

As $V = \frac{\kappa q}{r}$ or $V \propto \frac{1}{r}$

By increasing distance V decreases.

Example:

Two bodies having equal mass are moving with velocities 10 ms⁻¹ and 20 ms⁻¹ then the ratio between their K.E is

- (a) 1:2
- (b) 2:1
- (c) 1:4V
- (d) 4:1

Solution:

As $K.E = \frac{1}{2}mv^2$ or $K.E \propto v^2$ The ratio between velocity is 1:2 so ratio in K.E is 1:4

3. اگر کی ایک Quantity کو Half Double وغیره کردیاجائے تودو سر کی Quantity یر کیا اڑ ہوگا۔

Example:

If length of pendulum is doubled then its time period will become

- (a) Double
- (b) Half
- (c) $\sqrt{2}$ times \checkmark (d) $\frac{1}{\sqrt{2}}$ times

Solution: As $T = 2\pi \int_{a}^{\ell}$ or

 $T \propto \sqrt{\ell}$ If length is doubled T becomes $\sqrt{2}$ times.

(Two-Two Values Relationship)

4. اگرایک Quantity کی دوولیوز اور دو سر Quantity کی ایک value دی گئی ہو تو اس کی دو سر ی ولیو کیا ہوگی۔

Example:

If at pressure 10 atm the volume of the gas is $2m^3$. At what $\frac{p_2}{p_1} = \frac{v_1}{v_2} \Rightarrow P_2 = \frac{p_1 v_1}{v_2} = \frac{10 \times 2}{5}$ pressure the volume of the gas will be 5m3.

- (a) 5 atm
- (b) 4 atm
- (c) 3 atm
- (d) 2 atm

- independent dependent Quantities 3 Quantity 1 5 Solution:

Example:

Speed of sound in air is independent of:

(a) density of air

(b) pressure of air√

As $v = \sqrt{\frac{\gamma P}{\rho}}$ and $\rho \propto P$

(c) Temperature of air

(d) None of these

(Numerical Type Question)

6. Numerical Type Question کو Solve کرنے کے لیے Quantities کر کوئی اور کی ے بارے میں یو چھا گیا ہے اور ان کا آئی می Relation کیا ہے۔

Example: If a body of a mass 2kg is moving with momentum 6Ns then its K.E will be:

(a) 6 J

(b) 9 J

(c) 12 J (d) 15 J

Solution: As $K.E = \frac{p^2}{2m} = \frac{6^2}{2 \times 2}$ $= \frac{36}{4} = 9J$

$$=\frac{36}{4}=9J$$

(Re-arranging Formulas)

7. کی بھی فار مولے کو Re-arrange کے یا Variables ہدل کریج تھا جاسکا ہے۔

Example:

If T is time period of simple pendulum at a place where acceleration due to gravity is g then length of pendulum is:

(b) $\frac{gT}{4\pi^2}$ (c) $\frac{4\pi^2}{aT^2}$ (d) $\frac{4\pi}{aT^2}$

Solution:

$$As T = 2\pi \sqrt{\frac{\rho}{g}}$$

$$\ell = \frac{gT^2}{4\pi^2}$$

(Graphical Types Question)

Quantities .8 كات كياموكا كراف كي الموكار الدك في Area كيابتا كال

Example 1: The graph between potential energy stored in a capacitor verses voltage across the capacitor is:

Example 2: The slope of velocity time graph represent the: (a) displacement (b) acceleration (c) momentum (d) force Example 3: Area under force displacement graph represent the:

- (a) acceleration of the body (b) Work done on the body
- (c) Power of the body
- (d) Impulse on the body

Solution 1:

As $P.E = \frac{1}{2}CV^2$

 $P.E \propto V^2$

So the graph between P.E and Voltage is a parabola.

Solution 2:

Slope = v/t = a

Solution 3:

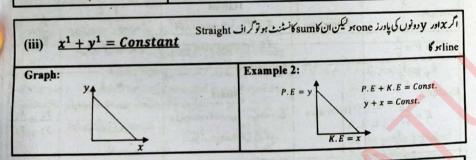

area = Fd = W

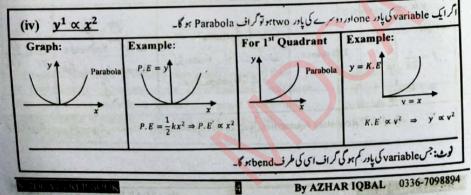

By AZHAR IQBAL 0336-7098894

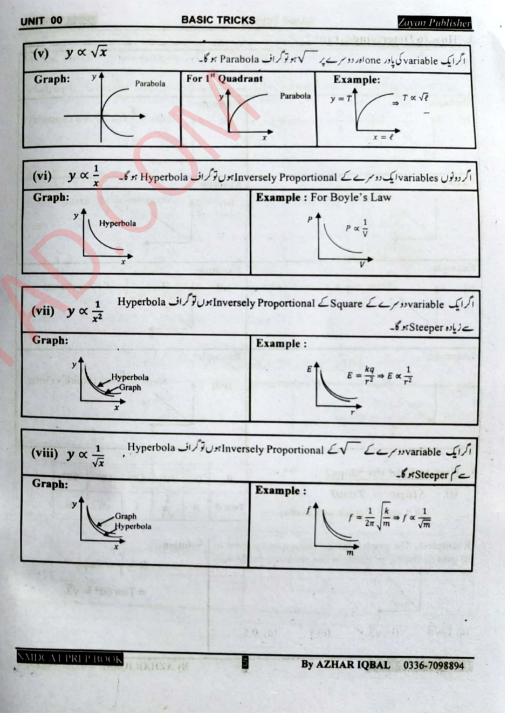

UNIT 00 2 Important Relations Between Quantities

Relation	If value of x increases then y	If value of x doubled then y	If values of x are in ratio 2:3 then ratio in y is	Two-Two values relation
$y \propto x$ Example: Q = CV $\Rightarrow Q \propto V$	Increases	Doubled چنا x مین آ در کار ۲ مجی در change در ناست	2 : 3 جو x شرع rratio گونتی و مثل مجمی ہوگی	$\frac{y_2}{y_1} = \frac{x_2}{x_1}$
$y \propto x^2$ Example: $K.E = \frac{1}{2}mv^2$ $\Rightarrow K.E \propto v^2$	Increases	Four times مرابع نے Square Evalues و مربع المام علم اللہ اللہ اللہ اللہ اللہ اللہ اللہ ال	اری square values کر کے square values کے catio	$\frac{y_2}{y_1} = \frac{x_2}{x_1}$
$y \propto \sqrt{x}$ Example: $T = 2\pi \sqrt{\frac{\ell}{g}}$ $\Rightarrow T \propto \sqrt{\ell}$	Increases	√2 times ربر کی خاص خوالاد پرکو خوالاد کا کی کی کار خوالاد کار	$ \sqrt{2}: \sqrt{3} $ $ \angle \int \sqrt{y} \text{ values } \int \sqrt{y} x $ $ \int \angle \text{ ratio } \sqrt{x} y = 0 $	$\frac{y_2}{y_1} = \frac{\sqrt{x}}{\sqrt{x}}$
$\Rightarrow T \propto \sqrt{\ell}$ $y \propto \frac{1}{x}$ Example: $PV = Const.$ $\Rightarrow P \propto \frac{1}{V}$	Decreases	Halved が Y - も こ T change かなな - も こ T change け time さい	3:2 אינאט ratio אינאט אינ אינאט אינאט אינ	$\frac{y_2}{y_1} = \frac{x_1}{x_2}$
$y \propto \frac{1}{x^2}$ Example: $E = \frac{kq}{r^2}$ $\Rightarrow E \propto \frac{1}{r^2}$ $y \propto \frac{1}{\sqrt{x}}$	Decreases	1 times 1 times 2 جائل کے square values فر x 1 کی کے کو لادhange کریا	9:4 Square Evalues في x التاكر في عرب التاكر في ك	$\frac{y_2}{y_1} = \frac{x_1^2}{x_2^2}$
$y \propto \frac{1}{\sqrt{x}}$ Example: $f = \frac{1}{2\pi} \sqrt{\frac{k}{m}}$ $\Rightarrow f \propto \frac{1}{\sqrt{m}}$	Decreases	1 times シグローグ√ Kvalues v x - ピー・テ な change v y ←	√3:√2 ニシン Evalues & x ≟ratio Cy = ニンピリ	$\frac{y_2}{y_1} = \frac{\sqrt{x_1}}{\sqrt{x_2}}$

4. Slope of the Graph:

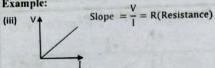

Slope = $\frac{y}{x}$

Example: d4

Example:	
(ii) F	Slope = $\frac{1}{x}$ = k (Spring Constant)
	_

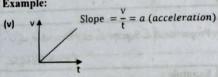

Example:

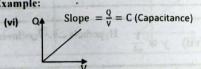

Example:

Slope = $\frac{Q}{t}$ = 1 (Current)

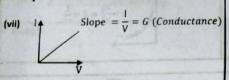

Example:

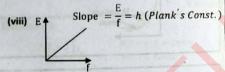

Example:

Example:

Example:

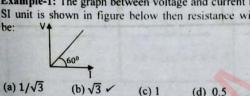

5. How to Find the Slope?

(i).
$$Slope = Tan\theta$$

(θ is angle of graph with x-axis)

θ	00	30°	45°	60°	90°
Tan θ	0	$\frac{1}{\sqrt{3}}$	1	√3	00

Example-1: The graph between voltage and current in | Solution: SI unit is shown in figure below then resistance will be:

$$R = \frac{V}{I} = slope$$
$$= Tan 60^{\circ} = V$$

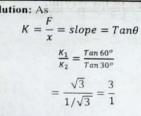

$$= Tan 60^{\circ} = \sqrt{3}$$

By AZHAR IQBAL 0336-7098894

Example-2: The graph between force and extension | Solution: As for two spring is shown in figure below then find the ratio between the spring constant.

(c) 1:1 (b) 3:1 ✓

(ii). Slope = $\frac{\Delta y}{\Delta x}$

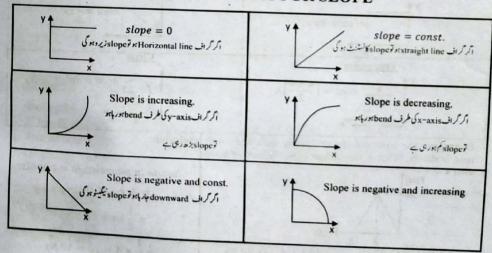

(a) 1:3

Example: The graph between charge and voltage for | Solution: capacitor is shown in figure below. The capacitance of capacitor will be:

(a) 5µF ✓ (b) 2.5µF (c) 15µF (d) $10\mu F$ $= 5\mu F$

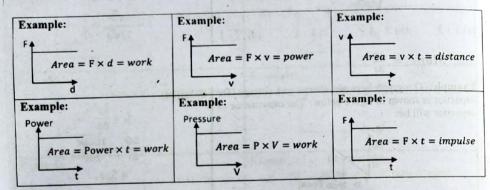

DIFFERENT CASES FOR SLOPE

MDCAT PREP BOOK

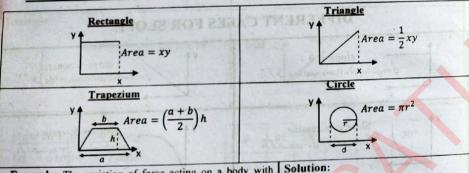

6. Area Under the Graph:

گرانے Areak کی represent کتاہے پید لگانے کیلئے x-axis اور auantities کی میں کہ کوئی quantity فارمولا بنا ہے۔

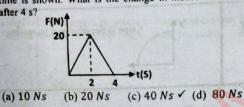

Note: Greater the area under the graph, larger the quantity.

7. How to find the area under the graph.

Example: The variation of force acting on a body with time is shown. What is the change in momentum of body after 4 s?

Change in momentum = impulse
$$= Area \text{ of triangle}$$

$$= \frac{1}{2} base \times height$$

$$= \frac{1}{2} \times 4 \times 20 = 40 \text{ Ns}$$

By AZHAR IQBAL 0336-7098894

8. Percentage Type Ouestions:

UNIT 00

If percentage change in X is less than 10% then percentage change in Y is given as: % change in Y = Power of X (% change in X)

(a) 6% (b)
$$\sqrt{6}$$
% (c) 3% \checkmark (d) 1.5%

Example:

If length of pendulum is increased by 6% then its time period will be increased by:

(a) 6% (b)
$$\sqrt{6}$$
% (c) 3% \checkmark (d) 1.5%

Solution: As $T = 2\pi \sqrt{\frac{\ell}{g}} \Rightarrow T \propto \sqrt{\ell}$ %change in $T = \frac{1}{2}$ (%change in ℓ) = 3%

2nd Type Suppose X and Y are related as $Y \propto X^2$

If percentage change in X is greater than 10% then percentage change in Y is given as: (i). When X increases:

% change in Y = 2(% change in X) +
$$\left(\frac{\text{% change in } X}{10}\right)^2$$

Example:

If momentum of a body increases by 20% then its K.E will be increased by:

(a) 20% (b) 40% (c) 44%
$$\checkmark$$
 (d) 400%

(ii). When X decreases:

Solution: As $K.E = \frac{P^2}{2m} \Rightarrow K.E \propto P^2$ % change in K.E= $2(20\%) + \left(\frac{20\%}{10}\right)^2 = 44\%$

% change in Y = 2(% change in X) -
$$\left(\frac{\text{% change in } X}{10}\right)^2$$

Example:

Example: If momentum of a body decreases by 10% then its K.E will be decreased by:

(a) 9% (b) 5% (c) 10% (d) 19%

Solution: As
$$K.E = \frac{\rho^2}{2m} \Rightarrow K.E \propto \rho^2$$
 % change in K.E= $2(10\%) - \left(\frac{10\%}{10}\right)^2$ = 44%

3rd Type: If change in X is multiple of 100%.

Example:

If length of the pendulum is increased by 100% Solution: As $T = 2\pi \sqrt{\frac{\ell}{g}} \Rightarrow T \propto \sqrt{\ell}$ then its time period will become:

(a) Double (b) Half (c)
$$\frac{1}{\sqrt{2}}$$
 times (d) $\sqrt{2}$ times

Solution: As
$$T = 2\pi \sqrt{\frac{\ell}{g}} \Rightarrow T \propto \sqrt{\ell}$$

If length increases by 100% its mean it is doubled. Then time period will become $\sqrt{2}$ times

" Change	100 %	200.04		The health
Quantity		200 %	300 %	400 %
Decomes	Doubled	Three times	Four times	Five times

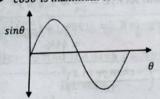

ADCAT PREP BOOF

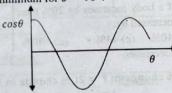

9. Trigonometric Ratios.

θ	0°	30°	45°	60°	90°
sinθ	0	$\frac{1}{2} = 0.5 = 50\%$	$\frac{1}{\sqrt{2}} = 0.7 = 70\%$	$\frac{\sqrt{3}}{2} = 0.86$ $= 86\%$	1 100%
cosθ	1% 100%	$\frac{\sqrt{3}}{2} = 0.86 = 86\%$	$\frac{1}{\sqrt{2}} = 0.7 = 70\%$	$\frac{1}{2} = 0.5$ = 50%	0 0%

Notice from the above table:

- \triangleright Value of $sin\theta$ increases by increasing angle and vice versa.
- \triangleright Value of $cos\theta$ decreases by increasing angle and vice versa.
- > $sin\theta$ is maximum for $\theta = 90^{\circ}$ and minimum for $\theta = 0^{\circ}$.
- \triangleright cos θ is maximum for $\theta = 0^{\circ}$ and minimum for $\theta = 90^{\circ}$.

e/m of neutron m/e of neutron		Infinite

By AZHAR IQBAL 0336-7098894

UNIT $01 \rangle$

FORCE AND MOTION

Mechanics:

Study of motion of objects is called mechanics. It is divided into two types.

- (i) Kinematics (ii) Dynamics
 - i. Kinematics: Study of motion of objects without referring the force.
 - ii. Dynamics: Study of motion of objects taking into consideration of force (the cause of motion)

FORCE AND MOTION

Distance:

Total length of path followed by body is called distance.

- > It is scalar quantity. its SI unit is meter.
- > It may be zero or positive but never negative.
- Distance of a body in motion can never be zero. Example: (i) For one vibration distance = 4A (ii) For one revolution distance = $2\pi r$

Example: Consider an object moves in a closed path 4m Total distance =3+4+5=12m

Displacement:

Change in position of a body from its initial position to find position is called displacement.

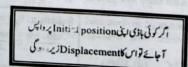

- > It is vector quantity and its direction is from initial to final position.
- > Its SI unit is meter

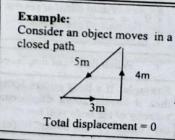

$$\vec{d} = \vec{r}_f - \vec{r}_i.$$

(Displacement = Final position vector - Initial position vector)

- It may be positive, negative or zero.
- It is shortest distance between initial and final position.
- Displacement is always less than or equal to distance.
- If a body moves in straight line its displacement
- and distance are equal.

Example: (i) For one vibration, displacement = 0(ii)For one revolution, displacement = 0

MDCAT PREP BOO

UNIT 01

Example: Find magnitude of displacement, if a body moves from $\vec{d} = \vec{r}_f - \vec{r}_i = (5\hat{\imath} + 7\hat{\jmath}) - (2\hat{\imath} + 3\hat{\jmath})$ point P(2, 3) to a point Q(5,7).

(a) 4m

(b) 5m (c) 7m (d) 17m

Solution:

$$\vec{d} = \vec{r}_{f} - \vec{r}_{i} = (5\hat{\imath} + 7\hat{\jmath}) - (2\hat{\imath} + 3\hat{\jmath})$$

$$= 3\hat{\imath} + 4\hat{\jmath}$$

$$|\vec{d}| = \sqrt{(3)^{2} + (4)^{2}} = 5m$$

Speed:

Distance covered by a body in one second is called speed.

- > It is scalar quantity and its SI unit is ms-1
- > It is always positive.
- > Speed of a moving object cannot be zero or negative.
- > The ratio of speed to magnitude of velocity of an object is always greater than one. total distance

Motion	Speed
Speed of electro magnetic waves	$3 \times 10^8 ms^{-1}$
Speed of Earth around the sun	$2.96 \times 10^4 \ ms^{-1}$
Speed of moon around the earth	$1\times10^3~ms^{-1}$
Speed of sound in air $(0^{\circ}C)$	332 ms ⁻¹
Speed of running cheetah	29 ms ⁻¹

Example:

Consider an object moves in a closed path of radius 2m with time period 3.14 sec. then its speed is

(a) 2ms⁻¹

(b) 4ms⁻¹ (c) 4πms⁻¹

(d) zero

Solution: .

Speed =
$$\frac{Total\ distance}{Time}$$
 = $\frac{2\pi r}{T}$ = $\frac{2\times 3.14\times 2}{3.14}$ = 4ms^{-1}

Velocity:

Rate of change of displacement of the body is called velocity.

- > It is vector quantity. Its SI unit is ms⁻¹.
- > It may be positive, negative and zero.
- > |v|is always less than or equal to speed.
- > For straight line motion in one direction $|\vec{v}| = speed$

$$\vec{v}_{av} = \frac{Total\ displacement}{Total\ time}$$

Example:

Consider an object move from one end to other end of diameter of a circle of radius 1m in 5sec

$$\vec{v}_{av} = \frac{Total \ displacement}{Total \ time}$$

$$=\frac{2r}{t}=\frac{2\times 1}{5}=0.4 \text{ ms}^{-1}$$

 d_1+d_2 When different displacements and time are given: Vav

Example: If a body covers 100m displacement in 4sec and Solution: $v_{av} = \frac{d_1 + d_2}{t_1 + t_2}$ then it covers 200m displacement in 6sec. The average velocity of the body will be:

(b) $20ms^{-1}$ (c) $30ms^{-1}$ (d) $40ms^{-1}$

 $\frac{100 + 200}{4 + 6} = \frac{300}{10} = 30 ms^{-1}$

(a) $10ms^{-1}$

By AZHAR IQBAL0336-7098894

When different velocities and time are given: $v_{av} = \frac{v_1 t_1 + v_2 t}{t_1 + t_2} (put \ d = v \ t)$

Example: If a body is moving with velocity 60ms-1 for 1st hour and 30ms-1 for next two hours. Then its average velocity of the body will be:

(a) $30kmh^{-1}\checkmark$ (b) $60kmh^{-1}$ (c) $90kmh^{-1}$ (d) $120kmh^{-1}$

Solution: $v_{av} = \frac{v_1 t_1 + v_2 t}{t_1 + t_2}$ $=\frac{(60)(1)+(30)(2)}{}$ $=30kmh^{-1}$

iii. If velocities are given and time internals are equal $(t_1 = t_2)$: $v_{av} = \frac{v_1 + v_2}{2}$

Example: If a car is moving a velocity 20 ms⁻¹ for 1st half | Solution: $v_{av} = \frac{v_1 + v_2}{2}$ hour and with velocity 30ms⁻¹ for next half hour. Then its average velocity of the body will be:

(a) $12.5ms^{-1}$ (b) $25ms^{-1}$ (c) $50ms^{-1}$ (d) $60ms^{-1}$

 $=\frac{20+30}{3}=\frac{50}{3}=25ms^{-1}$

iv. When different velocities and displacements are given: $v_{av} = \frac{(d_1+d_2)v_1v_2}{d_1v_2+d_2v_1}$ $(t=\frac{d}{v})$

Example: If a velocity of a body is $2ms^{-1}$ for 100m Solution: $v_{av} = \frac{(d_1+d_2)v_1v_2}{d_1v_2+d_2v_1}$ displacement and 4ms-1 for next 400m displacement. Then average velocity of the body will be:

(a) $3ms^{-1}$ (b) $3.3ms^{-1}$ (c) $6ms^{-1}$ (d) $6.3ms^{-1}$

= (100+400)×2×4 _ 4000 $(100\times4)+(400\times2) = 1200$ $= 3.3 ms^{-1}$

v. If displacement are equal $(d_1 = d_2)$.

Example: If body covers first half displacement with velocity 10ms-1 and next half displacement with velocity 20ms⁻¹. Then its average velocity of the body will be:

(a) $13.3ms^{-1}$ (b) $15ms^{-1}$ (c) $20.5ms^{-1}$ (d) $0ms^{-1}$

Solution: $v_{av} = \frac{2v_1v_2}{v_1v_2}$ $\frac{2\times10\times20}{10+20} = \frac{400}{30}$ $= 13.3 \text{ms}^{-1}$

Uniform Velocity:

If body covers equal displacements in equal intervals of time then it is moving with uniform velocity.

If body is moving with uniform velocity then instantaneous and average velocity are equal.

UNIT 01

Instantaneous Velocity:

Velocity of body at any particular instant of time is called instantaneous velocity. OR limiting value of $\frac{\Delta \vec{d}}{\Delta t}$ as time interval Δt approaches to zero.

$$\vec{V}_{ins} = \lim_{\Delta t \to 0} \frac{\Delta \vec{d}}{\Delta t}$$

Acceleration:

Rate of change of velocity of a body is called acceleration.

Average Acceleration:

$$\vec{a}_{av} = \frac{\overrightarrow{\Delta v}}{\Delta t} = \frac{\vec{v}_{\rm f} - \vec{v}_{\rm i}}{t}$$

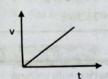

- ➤ It is vector quantity and its SI unit ms⁻²
- > Its direction is always along the direction of force.
- It may or may not be in the direction of velocity.
- Acceleration is positive and parallel to velocity when velocity of body increases.
- Accelerations is negative and anti-parallel to velocity when velocity of body decreases.
- > Acceleration is zero when velocity of the body is constant.
- Acceleration is perpendicular to velocity when speed of the body is constant and only its direction is changing. Example: Centripetal acceleration is perpendicular to velocity.

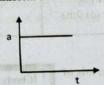

Uniform Acceleration:

Body is moving with uniform acceleration when its velocity changes equally in equal intervals of time.

Some important graph for uniform acceleration are shown in figure below

Instantaneous Acceleration

Acceleration of a body at any particular instant of time.

$$\vec{a}_{ins} = \lim_{\Delta t \to 0} \frac{\Delta \vec{v}}{\Delta t}$$

Acceleration is not zero when either magnitude or direction of velocity changes

Acceleration, change in velocity, force and impulse are always in same direction

VELOCITY-TIME GRAPH

- > Graph which illustrates the variation in velocity of the variation in velocity of the body
- \triangleright Slope of v t graph = acceleration.
- ightharpoonup Area under v t graph = distance covered.

Some Important Examples of Velocity-Time Graph

Graph	Velocity	Slope	Acceleration
v • • • • • • • • • • • • • • • • • • •	Constant $(v_i = v)$	Zero	Zero
*1/	Increasing	Positive and constant	Positive and constant
*	Increasing $(v_i = 0)$	Positive and increasing	Positive and increasing
*1	Increasing $(v_i = 0)$	Positive and decreasing	Positive and decreasing
· ·	First decreasing then increases in opposite direction $(v_i \neq 0)$	Negative and constant	Negative and constant
*	Increasing $(v_i \neq 0)$	Positive and constant	Positive and constan

Example 1:

The total distance and displacement covered from the

following v-t graph is +ve disp.

- (a) 50m, 50m
- (b) 50m, 30m
- (c) 30m, 50m
- (d) 50m, zero

Example 2:

If v-t graph for a body is shown in the figure below displacement is maximum for

(a) 1 (c) 3

(d) same for all

Example 3:

If v-t graph for two bodies is shown in the figure below then the ratio between their accelerations will be

(a) 1:1

(b) 1: √3

(c) 3:1

(d) √3:1

Solution:

distance = total area of triangles $=\frac{1}{2}(4)(10)+\frac{1}{2}(2)(10)$ $+\frac{1}{2}(4)(10)=50$

(Distance is always positive)

displacement = $\frac{1}{2}(4)(10)$ -

 $\frac{1}{2}(2)(10) + \frac{1}{2}(4)(10) = 30$

Solution:

 $S_1 > S_2 > S_3$

Equations of Motion

1st Equation:

 $V_f = V_i + at$

(جب distance ندویا کیا او توباتی کی quantity کو معلوم کرنے کے لیے Equation استعال کریں)

NMDCAT PREP BOOK

Example:

If a car accelerates uniformly from rest to a velocity 10ms⁻¹ in 50 sec. Then the acceleration of the car is

(a) 5 ms⁻¹

(b) 0.2 ms⁻²

(d) -0.2ms⁻² (c) 0.2 ms⁻¹

Solution:

 $v_i = v_i + at$

$$a = \frac{v_f - v_i}{t} = \frac{10 - 0}{50} = 0.2 \text{ms}^{-2}$$

2nd Equation:

$$S = v_i t + \frac{1}{2} a t^2$$

Example:

A ball is thrown vertically upward from a 100m high tower with velocity 5ms-1. The time taken by the ball to reach the ground will be

(a) 4s

(b) 5s

(c) 8s

(d) 10s

جود يكثر opposite _ initial velocity موع ان ك ساتحد لكعيس ك

Solution: $S = v_i t + \frac{1}{2} a t^2$

$$-100 = 5 t + \frac{1}{2} (-10) t^2$$

$$-20 = t - t^2 \rightarrow t^2 - t - 20 = 0$$

$$t^2-5t+4t-20=0$$

$$t(t-5)+4(t-5)=0$$

$$t - 5 = 0$$
 and $t + 4 = 0$

3rd Equation:

$$2as = v_f^2 - v_i^2$$

(جب " time " ندد یا گیامو توباق کی quantity کومعلوم کرنے کے (درستعال کرس) Equation

Example:

If a car moving with velocity 10ms⁻¹ is brought to rest in 25m distance then acceleration of the car will be

(a) 5 ms⁻²

(b) 0.5 ms⁻²

(c) 0.2 ms⁻²

(d) -0.5 ms⁻²

Solution:

$$2as = v_f^2 - v_i^2$$

$$2a \times 25 = (0)^2 - (10)^2$$

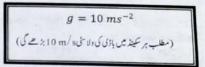

$$a = -0.5 \text{ ms}^{-2}$$

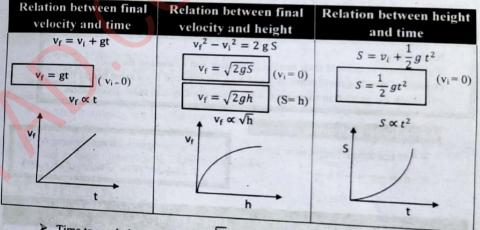

- Note:-These equations are only applicable for linear motion with uniform acceleration.
- Note:-Quantities opposite to initial velocity are taken negative. For example when body is thrown upward then acceleration due to gravity is taken negative.

MOTION UNDER THE ACTION OF GRAVITY

(i) When body falls downward:

- > When body starts from rest or falls freely or dropped or is released then $v_i = 0$.
- When body is thrown $v_i \neq 0$.
- $\Rightarrow a = g = 9.8 \, m/s^2 \approx 10 \, m/s^2$

ightharpoonup Time to reach the ground: $t = \frac{2s}{s}$ t = OR $t \propto \sqrt{h}$

Example:

UNIT 01

If a ball falling freely from a height "h" reaches the ground in 10 seconds then the time taken by the ball falling freely from height "2h" will be

- (a) 5 sec (c) 14 sec
- (b) 7 sec
- (d) 20sec

Solution: since $t \propto \sqrt{h}$

when height becomes two time then time will become $\sqrt{2}$ times $t = \sqrt{2} \times 10 = 14 \, sec$

MDCAT PREP BOOK

Distance covered in time t:

$$S = \frac{1}{2}gt^2$$

OR

$$S \approx 5t^2$$

Example

The distance covered by a freely falling body in three second is

- (a) 5m
- (b) 15m
- (c) 20m Solution:
- (d) 45m $S \approx 5t^2 = 5 \times 9 = 45m$

Distance covered in nth second:

$$S_{nth} = 10n - 5$$

Example

The distance covered by a freely falling body in 3rd second is

- (a) 5m
- (b) 15m
- (c) 20m
- (d) 45m

$$S = 10n - 5$$

= 10 × 3 - 5 = 20m

If air friction is ignored then motion is independent of mass of the body. For example if two bodies of mass 2kg and 4 kg are dropped from same height they will reach the ground in same time, with same velocity and same acceleration.

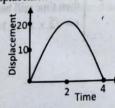

When body is thrown upward:

- ightharpoonup At maximum height $v_f = 0$.
- $\Rightarrow a = -g = -9.8 \frac{m}{s^2}$ $\approx -10m/s^2$

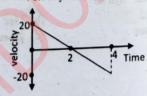

$$g = -10 \ ms^{-2}$$
 مطلب ہر سکینٹ میں باڈی کی وال سی $10 \ ms^{-1}$ کی ہوتی جائے گ

Time to reach maximum height:	Time of Flight	Maximum neight attained
$v_f = v_i + at$ At max. height $v_f = 0$ $t = \frac{v_i}{g}$	$S = v_i t - \frac{1}{2}gt^2$ For time of flight S = 0 $t = \frac{2v_i}{g}$	$v_f^2 - v_i^2 = -2gh$ At max, height $v_f = 0$ $h = \frac{v_i^2}{2g}$

NEWTON'S LAWS OF MOTION

- > Sir Isaac Newton published his three laws of motion in 1687 in his book 'principia'
- > Newton's laws are empirical laws.
- > Newton's laws are not applicable for sub-atomic particles and motion with speed approaching to speed of light.

1st Law of Motion:

A body at rest will remain at rest and a body moving with uniform velocity, continue its motion unless acted upon by some unbalanced external force.

- > It gives the qualitative definition of force.
- > It is also known as law of inertia.

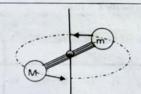

Inertia:

UNIT 01

- > Property of body tending to maintain its state of rest or uniform motion is called inertia.
- Mass of a body is quantitative measure of its inertia.

Example:

- A person standing in a bus falls backward due to inertia when bus suddenly starts moving.
- A person standing in a moving bus move forward due to inertia when brakes of the bus is applied suddenly.

Nobody moves or comes to

rest itself

(Abu-Ali- Sena)

A measurement of mass independent of gravity. When two masses are equal the rod will rotate without wobble about its center.

Inertial Frame of reference:

A frame of reference in which Newton's 1st law of motion valid.

> Non-accelerated frame ($\vec{v} = constant$) is inertial frame.

Example: A car moving with uniform velocity.

If both magnitude and direction of velocity are not changing then frame of reference is 'Inertial' In thrill machine rides at amusement parks there may be an acceleration of 3g or more. Without head rest this large acceleration may cause serious neck injury due to inertial effects.

Non-inertial Frame of reference:

A frame of reference in which Newton's 1st law of motion not valid.

► Accelerated frame ($\vec{v} \neq \text{constant}$) is non-inertial frame.

If either magnitude and direction of velocity are changing then frame of reference is 'Non-Inertial'

MDCAT PREP BOOK

By AZHAR IOBAL0336-7098894.

2nd Law of Motion:

A force applied on a body produces an acceleration in its own direction. This acceleration is directly proportional to applied force and inversely proportional to mass of the body.

 $\vec{a} \propto \frac{\vec{F}}{\vec{r}} \Rightarrow \vec{F} = m\vec{a}$

- Gives the definition of mass.
- > Direction of acceleration is always along the direction of force
- No force is needed to continue the motion of the object
- Force is only needed to change the motion (velocity) of the object.

Velo	city	Cha	nge
v elo	CILY	CHA	

Force is parallel to velocity		v or speed increases. Direction of velocity remains same.
Force is anti-parallel to velocity	F V	v or speed decreases. Direction of velocity remains same.
Force is perpendicular to velocity	F†	v or speed remains constant. Only direction of velocity change.
Force acts at some angle with velocity	, the state of the	Both magnitude and direction of velocity changes.

3rd Law of Motion:

"Every action has equal and opposite reaction". $(\vec{F} = -\vec{F})$

- > Action and reaction always act on different bodies.
- According to 3rd law forces always exist in pairs.
- > Action and reaction act on the line joining the two bodies.
- > Action and reaction never balance each other.

Example: Swimming is an example of Newton's law of motion

- (a) first
- (b) second
- (c) third V

(d) all of these

Throwing a package from a boat

(Newton's third law)

causes the boat to move backward

MOMENTUM

- > The moving object possess a quality by virtue of which it exerts a force on anything that tries to stop it. Quality was called quantity of motion of the body by Newton. Now it is called linear momentum.
- > Product of mass of body and its velocity is called momentum.

 $\vec{p} = m\vec{v}$

MDCAT PREP BOOK

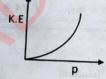

By AZHAR IQBAL0336-7098894

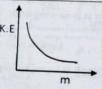

- > It is vector quantity and its direction is along the direction of velocity.
- > Its SI unit kgms-1 or N.s
 - If two bodies have same mass then $p \propto v$. The body moving faster will have larger momentum and vice versa.
 - If two bodies are moving with same speed then $p \propto m$ and heavier body will have larger momentum and vice versa.
 - If two bodies are moving with same momentum then $v \propto \frac{1}{m}$ and lighter body is moving faster and vice versa.
- K.E and momentum are related as

$K.E \propto \frac{1}{m}$ p	$\propto \sqrt{m}$
α	$\propto \frac{1}{m}$ p

Newton's 2nd Law in terms of momentum

"Time rate of change of momentum of a body" is equal to applied force.

$$\vec{F} = \frac{\Delta p}{\Delta t}$$

$$\vec{F} = \frac{m\vec{v}_f - m\vec{v}_i}{t}$$

- > This is the most general form of Newton's 2nd law of motion.
- > Force is directly proportional to change in momentum of the body.
- > Force is inversely proportional to time of impact.

Examples:

- > Helmet increases time of impact and reduces the force on the head to avoid serious
- ➤ Hair act like crumple zone, they increase the time of impact thus reduces the force. A force of 5N might be enough to fracture your naked skull (cranium) but with a covering of skin and hair a force of 50N would be needed.
- Air bags in cars increases the time of impact and thus reduces the force.

In knocking a bear down Lead bullet is more effective than rubber bullet of same momentum because time of impact for lead bullet is small and it will exert greater force

MDCAT PREP BOOF

velocities \vec{v}_1 and \vec{v}_2 after the collision then

(d) 1:1

(Lighter body will move faster)

(Lighter body will move faster)

When pursued plane returns the fire its speed and momentum increases

 $m_1\vec{v}_1 + m_2\vec{v}_2 = m_1\vec{v}_1 + m_2\vec{v}_2$

UNIT 01

Special Case:

then

below

figure

Impulse:

- Product of force and small interval of time (t) is called impulse.
- \Rightarrow Impulse = $\vec{F} \times t$
- > It is vector quantity and its direction is along the direction of force.
- > Its SI unit is kams-1 or N.s.
- > Impulse and momentum have same units.
- > Impulse = change in momentum of the body:

$\vec{F} \times t = m\vec{v}_f - m\vec{v}_f$
--

Moving bodies may or may not have impulse

- If body is moving with uniform velocity it has no impulse.
- If body is moving with variable velocity its momentum changes and it will have impulse.

If body accelerates from rest	If body brought to rest
$v_i = 0$	$V_f = 0$
$\vec{\mathbf{f}} \times \mathbf{t} = \mathbf{m} \vec{\mathbf{v}}_{\mathbf{f}}$	$\vec{F} \times t = -m\vec{v}_t$

Example:

The force required to stop a body moving with a velocity v in a time t is 'F'. The force required to stop the same body in same time if it is moving with velocity 2v is

(a) F

(c) 4F (b) 2F√

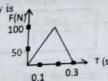

(d) F/2

> Area under force-time graph is equal to impulse.

Example:

MDCAT PREP BOOF

The graph between force and time for which force acts on the body is shown in the figure below. The change in the momentum of the body is

(a) 15 N- sec ✓ (b) 150 N- sec (c) 300 N-sec

Solution:

Since area under F-t graph is equal to impulse or change in momentum

$$\Delta p = \frac{1}{2}base \times height$$

$$\Delta p = \frac{1}{2} \times 0.3 \times 100$$

$$\Delta p = 15 N. sec$$

LAW OF CONSERVATION OF MOMENTUM

If no external force acts on the system then system is called isolated system.

Total linear momentum of an isolated system remains constant,

If
$$\vec{F}_{ext} = 0$$
 then $\frac{\Delta \vec{p}}{\Delta t} = 0$ or $\vec{p} = constant$

(Both magnitude and direction of linear momentum are conserved)

 $\vec{p}_1 = -\vec{p}_2$

energies?

(a)1:-1

(Both nucleus and alpha particle will have equal and opposite momentum)

(Lighter body will have greater K.E)

Example: what is ratio between their kinetic

- $p = mv \Rightarrow v \propto \frac{1}{2}$ (alpha particle will move faster due to smaller mass)
- (i). $K.E = \frac{p^2}{2m} \implies K.E \propto \frac{1}{m}$ (alpha particle will have greater K.E. due to smaller mass)

MDCAT PREP BOO

If two bodies collide with eachother and after the collision they move together then their common velocity after the collision is as

$$v = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2}$$

Example:

A 2500 kg truck moving with velocity 21ms⁻¹ collides with a stationary car of mass 1000 kg. The truck and car move together after the impact with common velocity

- (a) 5 ms⁻¹ (c) 10 ms⁻¹
- (b) 15 ms⁻¹ (d) 20 ms⁻¹

Solution:

$$v = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2}$$

$$v = \frac{2500 \times 21 + 1000 \times 0}{2500 + 1000}$$
$$v = 15 \text{ ms}^{-1}$$

ELASTIC COLLISION

- > A collision in which total K.E of the system is conserved is called elastic collision.
- > A bouncing ball will rebound to its original height.
- > During elastic collision none of K.E is converted into other forms of energy such as sound energy, heat energy etc.

Inelastic Collision:

- > A collision in which total K.E of the system is not conserved is called inelastic collision.
- > A bouncing ball will not rebound to its original height.
- K.E is converted into other forms of energy.

Note:

Total Energy and momentum remain conserved in both elastic and inelastic collisions.

ELASTIC COLLISION IN ONE DIMENSION

Consider two non-rotating balls moving in same direction collide with each other and after the collision they move along same line without rotation then

Before Collision

$$v_1 + v_1' = v_2 + v_2'$$

(If any three velocities are given you can find the fourth)

MDCAT PREP BOOK

- > Relative velocities before and after the collision have same magnitude but opposite direction. $v_1 - v_2 = -(v_1' - v_2')$
- > Magnitudes of relative velocity of approach is equal to magnitude of relative velocity of separation.

FORCE AND MOTION

> Velocities after the collisions are:

$$\mathbf{v_1'} = \frac{(m_1 - m_2)\mathbf{v_1}}{m_1 + m_2} + \frac{2m_2\mathbf{v_2}}{m_1 + m_2}$$

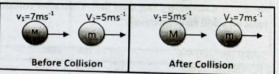

$$\mathbf{v_2}' = \frac{2m_1\mathbf{v_1}}{m_1 + m_2} + \frac{(m_2 - m_1)\mathbf{v_2}}{m_1 + m_2}$$

Four Special Cases

1st Case:

When two bodies of equal mass collide with each other they exchange their velocities after collision.

$$M = m$$

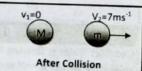

2nd Case:

When a moving ball collides with a stationary ball of equal mass they exchange their velocities after collision.

$$M = m$$

Before Collision

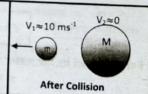

3rd Case:

When a moving lighter ball collides with heavier ball initially at rest then after the collision lighter ball moves backward with same velocity while heavier ball will remain at rest

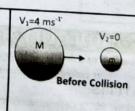

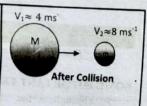

4th Case:

When a moving heavier ball collides with lighter ball initially at rest then after the collision velocity of heavier ball remains same while lighter ball will move with double velocity of heavier ball

NMDCAT PREP BOOK

Example:

A 70 g ball is moving with a velocity of 9 ms⁻¹ collides elastically with another ball of mass 140 g which is initially at rest. Then after collision their velocities will be respectively?

Solution: V2=0

$$v_1' = \frac{(m_1 - m_2)v_1}{m_1 + m_2}$$

$$v_1' = \frac{(70-140)9}{70+140} - 3 \text{ ms}^{-1}$$

$$\mathbf{v_2'} = \frac{2m_1\mathbf{v_1}}{m_1 + m_2}$$

$$v_2' = \frac{2 \times 70 \times 9}{70 + 140} = 6 \text{ms}^{-1}$$

Example:

A 100 g golf ball is moving with velocity of 20 ms⁻¹ collides elastically a stationary 8kg steel ball. Then after collision their velocities will be respectively?

Solution: V2=0

$${\bf v_1'} = \frac{(m_1 - m_2){\bf v_1}}{m_1 + m_2}$$

$$v_1' = \frac{(100 - 8000)20}{100 + 8000} - 19.5 \text{ ms}^{-1}$$

$$v_2' = \frac{2m_1v_1}{m_1 + m_2}$$

$$v_2' = \frac{2 \times 100 \times 20}{100 + 8000} = 0.5 \text{ms}^{-1}$$

FORCE DUE TO WATER FLOW

Consider water is flowing through a horizontal pipe with velocity v strikes a wall normally and comes to rest then

Force exerted by the wall on the water is given as

$$F = \frac{mv_f - r}{t}$$

$$F = \frac{-mv}{t}$$

Force exerted by the water on the wall is given as

$$F = \frac{mv_i}{t}$$

$$F = \frac{m}{t}v$$

PROJECTILE MOTION

"Two dimensional motion of a body under constant acceleration due to gravity is called projectile motion".

SOME IMPORTANT FEATURES:

Throughout the motion the acceleration is constant (a = g) and directed vertically

By AZHAR IQBAL0336-7098894

- > Vertical components of velocity continuously changes with time
- > Horizontal component of the velocity always remains constant.
- > Horizontal component of acceleration remains zero.
- > For short range the trajectory or path of projectile is parabola.
- > For long range the trajectory or path of projectile is elliptical.

Case-1:

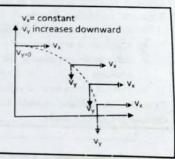

UNIT 01

If a body is projected in horizontal direction with velocity vx.

- > It moves forward due to inertia.
- > It moves downward due to gravity

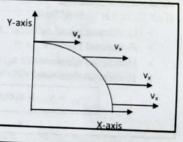

Example: A bomber moving in horizontal direction drops a bomb when it is just above its target but he misses the target due to

- (a) horizontal velocity
- (b) inertia
- (c) gravity
- (d) both a and by

Horizontal Motion:

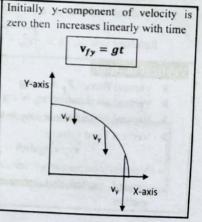

- > If air friction is ignored then force along X-axis remains zero : $F_x = 0$
- Horizontal component of acceleration is always zero. $a_x = 0$
- > Horizontal component of velocity remains constant (horizontal component of velocity is same at all the points)

Vertical Motion:

- Force along y-axis: $F_y = mg$
- \triangleright Acceleration along y-axis: $a_y = g$
- > Initial vertical velocity is zero and it increases with time.
- ➤ Vertical final velocity: $v_{fy} = \sqrt{2gh}$

MDCAT PREP BOOK

> Resultant acceleration: $a = \sqrt{a_x^2 + a_y^2} = \sqrt{0 + g^2} = g$

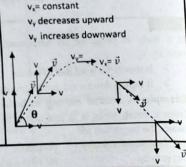

> Resultant velocity: $\mathbf{v} = \sqrt{\mathbf{v}_x^2 + \mathbf{v}_y^2} = \sqrt{\mathbf{v}_x^2 + g^2 \mathbf{t}^2} = \sqrt{\mathbf{v}_x^2 + 2gh}$

Case-2:

Consider Body is projected at an angle " θ " with the horizontal and initial velocity vi

- $\triangleright \theta$ is known as angle of projection
- > vi is known as velocity of projection
- > horizontal component of velocity remains
- vertical component of velocity vary with time

Example: A ballistic missile fired from a certain distance at a certain angle.

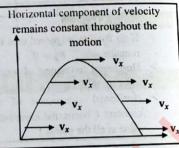

Horizontal motion:

If air friction is ignored then.

- \triangleright Horizontal initial velocity: $\mathbf{v}_{ix} = \mathbf{v}_i \mathbf{cos} \boldsymbol{\theta}$
- ➤ Horizontal force: F_x = 0
- \rightarrow Horizontal acceleration: $a_x = 0$
- ➤ Horizontal final velocity:

$$\mathbf{v}_{fx} = \mathbf{v}_{ix} = \mathbf{v}_i \cos \theta$$

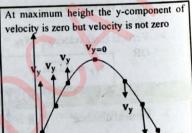

Resultant acceleration: $a = \sqrt{a_x^2 + a_y^2} = \sqrt{0 + (-g)^2} = g^{-1}$ Resultant velocity: $\mathbf{v} = \sqrt{\mathbf{v}_{fx}^2 + \mathbf{v}_{fy}^2} = \sqrt{(\mathbf{v}_i \mathbf{cos}\theta)^2 + (\mathbf{v}_i \mathbf{sin}\theta - \mathbf{gt})^2}$

Vertical motion:

- \triangleright Vertical Force: $F_v = -mg$
- \triangleright Vertical acceleration: $a_y = -g$
- \triangleright Vertical initial velocity: $\mathbf{v}_{i\mathbf{v}} = \mathbf{v}_{i} \mathbf{sin} \boldsymbol{\theta}$
- ➤ Vertical Final velocity:

$$v_{fy} = v_i \sin\theta - gt$$

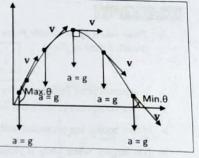

> Vertical component of velocity decreases in upward motion and increases in downward

By AZHAR IQBAL0336-7098894

Angle between velocity & acceleration:

- > Angle between velocity and acceleration of projectile is maximum at point of projection.
- > Angle between velocity and acceleration decreases with time
- At maximum height velocity and acceleration are perpendicular to each other.
- > At the point where the body hits the ground the angle between velocity and acceleration is minimum.

At max height

UNIT 01

- Y-component of velocity = 0.
- \triangleright Velocity is minimum and $\mathbf{v} = \mathbf{v}_i \cos \theta$.
- ➤ Angle between velocity and acceleration is 90°

$$P.E = mgh = mg\left(\frac{v_i^2 sin^2 \theta}{2g}\right) = \frac{1}{2} mv_i^2 sin^2 \theta$$

 $K.E = \frac{1}{2}m(v_i\cos)^2 = \frac{1}{2}mv_i^2\cos^2\theta$

Maximum Height:

(Maximum distance covered by a projectile in vertical direction is called maximum height)

$$H = \frac{{v_i}^2 sin^2 \theta}{2g}$$

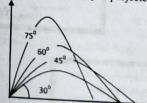

- > It depends upon initial velocity, angle of projection and acceleration due to gravity.
- > If two bodies are projected at same angle then

$$H \propto v_l^2$$
 and $\left(\frac{H_1}{H_2} = \frac{v_1^2}{v_2^2}\right)$

> If two bodies are projected with same speed then

$$H \propto \sin^2 \theta$$
 and $\left(\frac{H_1}{H_2} = \frac{\sin^2 \theta_1}{\sin^2 \theta_2}\right)$

ightharpoonup H is largest when body is projected vertically upward ($\theta = 90^{\circ}$) and $H_{max} = \frac{v_t^2}{2g}$.

MDCAT PREP BOOL

Time of Flight:

- > Time taken by projectile from its point of projection to the point where it hit the ground is called time of flight.
 - 2visin0
- > It depends upon initial velocity, angle of projection and acceleration due to gravity.
- > If two bodies are projected at same angle then $t \propto v_1 \left(\frac{t_1}{t_2} = \frac{v_1}{v_2}\right)$.
- > If two bodies are projected with same speed then $t \propto \sin\theta \left(\frac{t_1}{t_2} = \frac{\sin\theta_1}{\sin\theta_2}\right)$.
- > It is largest when body is projected vertically upward $(\theta = 90^{\circ})$ and $t_{max} = \frac{2v_1}{g}$.

Note
Time to reach maximum height is
$\frac{v_i sin\theta}{g}$.

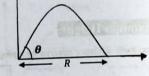

Horizontal Range:

Maximum distance covered by projectile in horizontal direction is called range

$$R = v_{ix}t$$
 or

or
$$R = \frac{v_i^2 \sin 2\theta}{g}$$

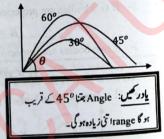

- > It depends upon initial velocity, angle of projection and acceleration due to gravity.
 - > If two bodies are projected with same speed then

$$R \propto \sin 2\theta$$
 and $\left(\frac{R_1}{R_2} = \frac{\sin 2\theta_1}{\sin 2\theta_2}\right)$

> If bodies are projected at same angle then

$$R \propto v_i^2$$
 and $\left(\frac{R_1}{R_2} = \frac{v_1^2}{v_2}\right)$

> Range of projectile is maximum when body is projected at 45° and $R_{max} = \frac{v_i^2}{g}$

Note: For some of initial speed, angle of projections for which $\theta_1 + \theta_2 = 90^\circ$, Horizontal ranges are equal. Example: At 30° and 60° horizontal ranges are equal.

By AZHAR IQBAL0336-7098894

Relation between maximum height and range:

$$H = \frac{1}{4}Rtan\theta$$

 $H = \frac{1}{4}R_{max}$ (For maximum range $\theta = 45^{\circ}$ and $\tan 45^{\circ} = 1$)

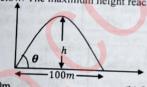

FORCE AND MOTION

For $\theta = 76^{\circ}$ maximum height and range are equal.

Example:

UNIT 01

The trajectory of a ball thrown at an angle of 45° is shown in the figure below. The maximum height reached by the ball is

(a) 100m (c) 400m

(b) 200m

(d) 25m

Solution:

$$H = \frac{1}{4}R \tan\theta$$
$$= \frac{1}{4} \times 100 \times \tan 45$$

$$H = 25m$$

Example:

The range of projectile will be four times the height of projectile at an angle of

Solution:

$$H = \frac{1}{4}R \tan\theta$$

$$H = \frac{1}{4} \times 4H \tan\theta$$

$$\tan\theta = 1 \text{ or } \theta = 45^{\circ}$$

Example:

If the range of projectile and height of projectile are related as $R = \frac{4H}{\sqrt{3}}$ then angle of projection will be

Solution:

$$H = \frac{1}{4}R \tan\theta$$

$$H = \frac{1}{4} \times \frac{4H}{\sqrt{3}} \tan\theta$$

$$\tan\theta = \sqrt{3}$$

Relation between maximum height and time of flight:

$$H = \frac{1}{8}gt^2$$

Example:

If the ratio between time of flight of two different bodies is 2:3 then the ratio between their maximum height will be

Solution:

 $H \propto t^2$ Ratio between height is determined by taking square of the ratio between time

MDCAT PREP BOOF

UNIT 01

FORCE AND MOTION

Zavan Publisher

If time of flight of a projectile is four seconds the maximum height reached by projectile is

(a) 10m

(b) 20m

(c) 40m

 $H = \frac{1}{2}gt^2$

$$H = \frac{1}{8} \times 10 \times (4)^2$$

$$H = 20m$$

Solution:

Relation between Range and Time of flight:

$$R \tan\theta = \frac{1}{2} gt^2$$

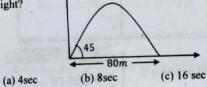

$$R_{max} = \frac{1}{2}gt^2$$

(d) √8sec

(d) 50m

Example:

Trajectory of a body is shown in the figure below. What is its time of flight?

Solution:

 $R \tan\theta = \frac{1}{2} gt^2$

$$80 \times Tan45$$
$$= \frac{1}{2} \times 10 \times t^2$$

$$t^2 = 16$$

Ballistic Flight:

Ballistic flight is that in which projectile is given an initial push and then allowed to move freely due to inertia and under action of gravity.

Ballistic Missile:

The unpowered and unguided missile is called ballistic missile.

- > The ballistic missiles are useful only for short ranges.
- Powered and remote controlled guided missiles are used for long ranges and greater precision.

Ballistic Trajectory:

The path followed by ballistic missile is called ballistic trajectory.

If we consider earth as a flat surface, the shape of trajectory is parabolic and its range is short. If we consider earth spherical, the shape of trajectory is elliptical.

By AZHAR IQBAL0336-7098894

UNIT 02

WORK AND ENERGY

Zayan Publisher

UNIT $02 \rangle$

WORK AND ENERGY

WORK DONE BY CONSTANT FORCE

"The product of magnitude of displacement and component of force in the direction of displacement is called work done on the body."

Work is scalar quantity and its unit is Joule.

In cgs system unit of work is erg.

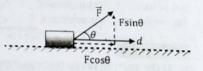

$$1erg = 10^{-7}J$$

Example:

If a body is moving under the action of constant force as shown in the figure below then the

(c) Fd Tano (d) - Fd Cosθ

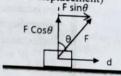

$$W = (Fcos\theta)(d)$$

$$W = Fdcos\theta = \vec{F}.\vec{d}$$

Solution: W=displacement(component of force parallel to displacement)

 $= Fd sin\theta$

Example:

At what angle between force and displacement more work is done.

(b) 40°

(d) 80°

Example:

At what angle between force and displacement the work done on the body is just 50% of maximum work

(a) 30° (c) 60°

(b) 45°

(d) 90°

Solution:

smaller the angle, larger the value of Cost

Work will be maximum when angle is smallest

Solution:

Sine value of Cos60°=1/2 Hence work done is 50% when $\theta = 60^{\circ}$

Positive work:

If the angle between force and displacement is less than 90° then work is positive.

Example:

If the angle between force and displacement of the body is 30° then work done will be (c) negative (d) minimum

NMDCAT PREP BOOK

Work done in term of rectangular components

 $W = \vec{F} \cdot \vec{d} = (F_x d_x + F_y d_y + F_z d_z)$

Negative work:

If the angle between force and displacement is greater than 90° then work is negative. (Work done by friction is always negative) .

Example:

If a body is moving under the action of constant force as shown in the figure below then the work done on the body is

- (a) positive
- (b) negative
- (d) minimum (c) maximum

Solution:

Since the angle between force and displacement is greater than 90°. Hence work done will be negative.

Zero work:

1. If the angle between force and displacement is 90° then work is zero.

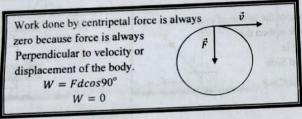

Example:

Work done by magnetic force on a moving charge in a magnetic field is always

(a) positive (b) negative (c) zero (d) none of these

Solution:

Magnetic force on a moving charge is always perpendicular to velocity or displacement.

2. If the body covers no displacement then work is zero.

Example:

Work done by a man pushing the rigid wall is zero because

(a) force is zero

- (b)√ displacement is zero
- (d) force and displacement are perpendicular
- 3. If force acting on the body is zero (body is moving with uniform velocity or speed) then work done on it is zero

Example:

If a car is moving with uniform velocity then work done on the car by Engine ,Friction and net force is respectively

- (a) positive, negative, positive
- (b) positive, negative, negative
- (c) positive, negative, zero
- (d) positive, zero, positive

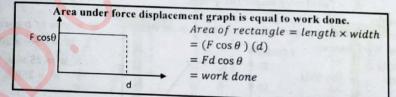

Solution:

Work done by Engine = $Fd\cos 0^\circ = +Fd$. Work done by Friction = $Fd\cos 180^\circ = -Fd$. Net work done = 0 (As car is moving with uniform velocity so

a = 0 and $F_{net} = 0$)

Solution:

 $\vec{d} = \vec{r}_f - \vec{r}_i$ $=(5\hat{\imath}-2\hat{\jmath})-(2\hat{\imath}+3\hat{\jmath})=3\hat{\imath}-5\hat{\jmath}$ $W = \vec{F} \cdot \vec{d} = (4\hat{\imath} + 6\hat{\jmath}) \cdot (3\hat{\imath} - 5\hat{\jmath})$ = (4)(3) + (6)(-5) = -181

Example:

(c) 40J

UNIT 02

Example:

(a) 9 J

(c) 18 J

The graph between displacement and component of force in the direction of displacement for a body is shown in the figure below. F Cos (N

If a force $\vec{F} = 4\hat{\imath} + 6\hat{\jmath}$ displaces the body from point

p(2,3) to a point Q(5,-2) then what is work done.

(b) -9 J

(d) -18 J

Work done on the body is .(a) 20J (b) 30J

(d) 50J

Solution:

W = total area $W = (10 \times 2) - (2 \times 5)$ $+(2 \times 5)$ W = 20 - 10 + 10W = 201

WORK DONE BY VARIABLE FORCE

In most cases force is not constant throughout the displacement but it is variable.

(i) In stretching a spring. Work is done by variable force $(F \propto x)$. **Example:** Force – displacement graph for a body is shown

in the figure below. Work done on the body is (a) 7.5J

(b) 15J F(N) 100 (c) 7501 (d) 1500J 50 x (cm) 10

Solution:

W = area of triangle

ADCAT PREP BOOK

(ii) A rocket moving away from earth. Work is done by variable force $(F \propto \frac{1}{r^2})$.

(iii) Two positive point charges are brought closer to each other. Work is done by variable force $(F \propto \frac{1}{2})$.

To calculate work done by variable force there are two methods.

I. we divide the path into small intervals so that in each interval force approximately remains constant then we calculate work done during each interval by using relation

$$W_i = \overrightarrow{F_i} \cdot \Delta \overrightarrow{d_i} = F_i \Delta d_i \cos \theta_i \text{ then}$$

$$W_t = \sum_{i=1}^n F_i \Delta d_i \cos \theta_i$$

displacement and plot a graph between force $W_t = Total$ area under the graph.

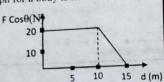

Example:

Force - displacement graph for a body is shown in the figure below. Work done on

the body is (a) 50J

(b) 200J

Solution:

W = area of trapezium $W = \frac{10+15}{2} \times 20$ $W = 25 \times 10$ W = 2501

WORK DONE BY GRAVITATIONAL FORCE

> Region or space around the earth in which its gravitational force acts on the body is called gravitational field.

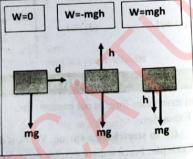

In the Gravitational Field:

- (i) If a body is displaced in horizontal direction, work done by gravity is zero.
- (ii) If body is displaced in upward direction then work done by gravity is negative

$$(W=-mgh).$$

(iii)If body is displaced in downward direction then work done by gravity is positive

$$(W = mgh)$$

Example:

A person holding a 10kg bag covers a displacement 5m in horizontal direction. How much work is done by gravity

(a) 50J

(b) 500J

(c) -500J

(d) zero

Solution:

Since force of gravity is perpendicular to displacement Hence work is zero

By AZHAR IQBAL 0336-7098894

(i) Work done by gravity is independent of path followed.

Along path1:

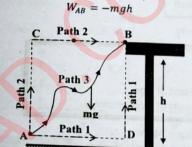

UNIT 02

$$W_{AB} = W_{AD} + W_{DB} = 0 + (-mgh) = -mgh$$
Along path2:

$$W_{AB} = W_{AC} + W_{CB} = (-mgh) + 0$$
$$= -mgh$$

Along path3:

$$W_{AB} = -mg(total\ verical\ displacement)$$

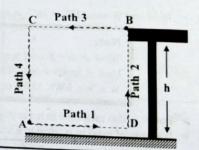

Work done by Gravity in a closed path is zero

$$W_{ADBCA} = W_{AD} + W_{DB} + W_{BC} + W_{CA}$$

$$W_{ADBCA} = 0 + (-mgh) + 0 + (+mgh)$$

$$W_{ADRCA} = 0$$

Conservative Force:

- > The force for which work done in closed path is zero is called conservative force.
- > The force for which work is independent of the path followed by the body is called

Examples:

Gravitational force, electric force, elastic force. are conservative forces.

Non-Conservative Force:

- Work done depends upon the path followed (Longer the path, larger the work).
- Work done in closed path is not equal to zero. Work done on aeroplane by air friction is not zero in a closed path and longer the path followed by aero plane, larger the work done by air friction.

Examples:

> Friction, Viscous force, Normal force, Tension, Air resistance, Propulsive force of rocket

ADCAT PREP BOOL

 p^2

POWER

"Rate at which work is being done.

OR Work done by a body per unit time is called power of the body."

> Average power:

$$P_{av} = \frac{Total\ work}{Total\ time} = \frac{W}{t}$$

> It is a scalar quantity. It is equal to dot product of force and velocity.

$$P = \vec{F}.\vec{v} = FV cos\theta$$

 $Its SI unit is watt (1W = Js^{-1} = kgm^2s^{-3}).$

Note:

Work done = Power × time

Unit of power × unit of time = unit of work

W.s, Wh, kWh, MWh etc. are units of work or energy.

- > Power is also measured in horse power.(1hp = 746 W)
- > If a body of mass m is lifted to a height h then power is given as

$$P=\frac{mgh}{t}.$$

If work done is equal to change in K.E.

$$P = \frac{\frac{i}{2}mv_2^2 - \frac{1}{2}mv_1^2}{t}$$

If work done is equal to change in P.E.

$$P = \frac{mgh_2 - mgh_1}{t}$$

Kilo-Watt Hour:

"One Kilowatt hour is work done in one hour by an agency whose power is one kilowatt."

$$1Wh = 3.6 \text{ kJ}$$
 $1kWh = 3.6MJ$ $1MWh = 3.6GJ$

Kilowatt hour is the commercial unit of electrical energy

ENERGY

Capacity of a body to do work is called energy.

- There are many types of energy such as K.E, P.E, sound energy, heat energy, electrical energy, chemical energy, solar energy etc.
- Mechanical energy can either be K.E or P.E
- > It is a scalar quantity

MDCAT PREP BOOK

- > Its SI unit is joule $(1J = N.m = kg m^2 s^{-2})$
- > Work and energy have same units.

By AZHAR IQBAL 0336-7098894

Kinetic Energy

UNIT 02

"Energy possessed by a body due to its motion is called kinetic energy."

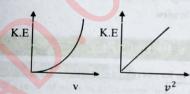

> Kinetic energy cannot be negative:

In terms of velocity

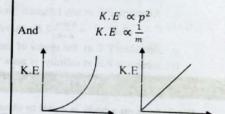

It depends upon mass of the body and its velocity

$$K.E \propto v^2$$
 $K.E \propto m$

In terms of momentum

$$K.E = \frac{P^2}{2m}$$

Potential Energy

And

Energy possessed by a body due to its position in the force field or due to its

- > P.E is always determined relative to some reference point where P.E is taken zero.
- > Reference point can be chosen anywhere.

NOTE:

P.E due to force of attraction is always negative P.E due to force of repulsion is always positive

Examples:

- o Gravitational P. E = mgh (if surface of earth is taken as a reference point)
- Absolute gravitational $P.E = -\frac{GMm}{2}$ (if reference point is taken at infinity where force of gravity is zero)
- Elastic $P.E = \frac{1}{2}kx^2$
- Electrical P.E between two point charges = $\frac{kq_1q_2}{q_1q_2}$
- Electrical P.E stored in capacitor = $\frac{1}{2}CV^2$
- Magnetic P.E stored in an Inductor = $\frac{1}{2}LI^2$
- Energy stored in compressed or stretched spring is called elastic P.E.

ABSOLUTE POTENTIAL ENERGY

"Absolute P.E at any point is defined as work done by gravitational field in moving the object from that point to infinity where force of gravity becomes zero."

o Absolute P.E at any distance r from the center of earth is given as

$$P.E = -\frac{GMm}{r}$$

(absolute P.E is always negative)

o Absolute P.E on the surface of earth is given as

$$P.E = -\frac{GMm}{R}$$

o Absolute P.E at any height h from the surface of earth is given as

 $P.E = -\frac{GMm}{R+h}$ (by increasing the height absolute P.E increases)

- Absolute P.E at the center of earth is zero.
- o Absolute P.E at infinity is zero.

WORK ENERGY PRINCIPLE

Work done on a body is equal to change in its energy .

$$W = \Delta K.E + \Delta P.E$$

- > If work done on the body is positive then its energy increases.
- ➤ If work done on the body is negative then its energy decreases.
- ➤ If work done on the body is zero then its energy remains constant.

Case 1:

If work done by conservative force is zero then P.E=0 and

$$W = \Delta K. E$$

OR
$$Fd = \frac{1}{2}mv_f^2 - \frac{1}{2}mv_i^2$$

- > If work done on the body is positive then its K.E increases.
- > If work done on the body is negative then its K.E decreases.
- > If work done on the body is zero then its K.E remains constant.

If body is accelerated from rest then $v_i = 0$

$$Fd = \frac{1}{2}mv_f^2$$

If body is brought to rest $v_f = 0$

$$Fd = -\frac{1}{2}mv_i^2$$

Case 2:

If work is done by conservative force while keeping the body in equilibrium then K.E=0 $W = \Delta P.E$ and

$$W = mgh_2 - mgh_1$$

- > If work done on the body is positive then its P.E increases.
- > If work done on the body is negative then its P.E decreases.
- > If work done on the body is zero then its P.E remains constant.

By AZHAR IQBAL 0336-7098894

Example:

UNIT 02

If 1000N force is required to stop a car moving with velocity 10ms-1then the force required to stop the car in same distance when it is moving with velocity 20ms- will be

(a) 500N

- (b) 1000N
- (c) 2000N
- (d) 4000N

Example:

What is force required to accelerate an object of mass 1kg from rest to a velocity 4ms in a distance 10m

- (a) 0.4 N (c) 4 N
- (b) 0.8 N
- (d) 8 N

Solution:

$$Fd = -\frac{1}{2}mv_l^2$$

As 'd' and are same so

 $F \propto v^2$

If v is doubled then F becomes 4 times $(4 \times 1000 = 4000N)$

Solution:

$$Fd = \frac{1}{2}mv_f^2$$

$$F \times 10 = -\frac{1}{2} \times 1(4)^2$$
$$F = 0.8N$$

INTERCONVERSION OF K.E AND P.E.

In the absence of air friction

If a body of mass m falls under the action of gravity from a height h as shown in the figure.

- Loss in P.E is equal to gain in K.E.
- > Total energy always remains constant.

After falling downward distance X

- \triangleright Loss in P.E = mgx
- \rightarrow % loss in P.E = $\frac{x}{h} \times 100$
- \triangleright Gain in K.E = mgx
- > % Gain in K.E = $\frac{x}{h}$ × 100
- ➤ Gain in speed/velocity = $\sqrt{2gx}$

Velocity of object falling under gravity

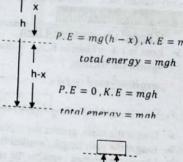

Gain in K.E = loss in P.E

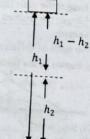

$$\frac{1}{2}m(v_2^2 - v_1^2) = mg(h_1 - h_2)$$

 \triangleright If at height h_1 body is moving with velocity v_1 then at height h2 velocity of the body will be

$$v_2 = \sqrt{2g(h_1 - h_2) + v_1^2}$$

If body falls from rest then $v_1 = 0$

$$v_2 = \sqrt{2g(h_1 - h_2)}$$

$$v \propto \sqrt{(h_1 - h_2)}$$

v ∝ √vertical distance

- > Velocity only depends upon initial and final height and is independent of mass of the body and path followed.
- \triangleright If body reaches the ground then $h_1 = 0$

$$v = \sqrt{2gh}$$

$$v \propto \sqrt{h}$$

LAW OF CONSERVATION OF ENERGY

Energy cannot be destroyed. It can be transformed from one kind to another but total amount of energy always remains constant.

Example:

Two balls of different masses rolls down from a frictionless plane as shown in the figure below then which balls is

- (a) bigger ball
- (c) ✓ both are moving with same speed
- (b) smaller ball
- (d) depend upon path length

Solution:

If body is thrown upward then

Loss in K.E = Gain in P.E +

Work done against the friction.

 $\frac{1}{2}mv^2 = mgh + fd$

$$v = \sqrt{2gh}$$

Velocity only depends upon height and is independent of mass of the body and path followed

In the Presence of friction

If body falls downward then

Loss in P.E = Gain in K.E + Work done against the friction.

$$mgh = \frac{1}{2}mv^2 + fd$$

- Figure 6. Gain in speed: $v = \sqrt{2\left(gh \frac{fd}{m}\right)}$
- > Larger the mass, greater the speed.
- Larger the path length, smaller the speed.
- > Larger the friction, smaller the speed

Solution:

Two balls of different masses rolls down from a rough plane

(a) bigger ball

Example:

- (c) both are moving with same speed
- (b) smaller ball
- (d) depend upon path length

- In presence of friction
- greater the speed. o smaller the path .

larger the speed

UNIT 03 >>

ROTATIONAL AND CIRCULAR MOTION

Circular Motion:

"Motion of a body moving in circular path or motion of a body whose distance from axis of rotation remains constant is called circular motion".

Examples:

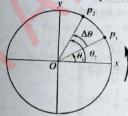

- Motion of satellites around the earth
- Motion of car moving on a circular track.
- Motion of stone tied with a string, rotating in a circular path.

ANGULAR DISPLACEMENT

"Angle subtended at the center in small internal of time or angle $\Delta\theta$ which gives the change in angular position of a body is called angular displacement".

Examples:

If body moves from point A to B on circular path then its angular displacement is $\Delta\theta$

Note One radian is the angle between two radii which cut off on the circumference an arc equal to radius

Note

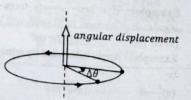

Rotational motion is either two or three dimensional motion and cannot be one dimensional.

- > SI unit of angular displacement is radian and other units are degree, revolution etc.
- For small value, angular displacement is vector quantity.
- > For large value angular displacement is not vector because it does not obey the vectors laws such as commutative law $(\theta_1 + \theta_2 = \theta_2 + \theta_1)$.

Example: if a body moves from one end of the diameter to other then angular (a)90° (b) 180° V (c) 270°

Right hand rule :

Direction of angular displacement is along axis of rotation and it is determined by right hand rule. (Rotate fingers in direction of rotation while keeping the thumb erect then thumb indicates the direction of angular displacement).

(d) 360°

OCAT PREP BOOK

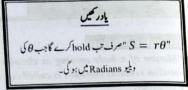

Rotation between Linear and Angular displacement:

If a particle moving in circular path of radius r, covers an arc length S and angular displacement θ then

$$S = r\theta$$

If a body is rolling without slipping then its linear distance is equal to arc length.

Examples:

If a wheel of radius 0.5m is rolling without slipping then its linear distance covered in 3-revolutions will be

(a)1.5m

- (b)2m

solution:

 $s = r\theta = 0.5 \times 3 \times 2\pi$ $=3\pi m = 9.4 m$

 $(1 rev = 2\pi rad)$

(c) 5.4m

(d) 9.4m

Conversion of degree into radian:

$$> 30^{\circ} = 30 \times \frac{\pi}{180} = \frac{\pi}{6} rad$$

$$> 45^{\circ} = 45 \times \frac{\pi}{180} = \frac{\pi}{4} \ rad$$

$$> 60^\circ = 60 \times \frac{\pi}{180} = \frac{\pi}{3} \, rad$$

Conversion of Radian into radian:

$$\Rightarrow \frac{\pi}{2} \text{rad} = \frac{180^{\circ}}{2} = 90^{\circ}$$

$$\pi \text{rad} = 180^{\circ}$$

$$\Rightarrow \frac{3\pi}{2} \text{ rad} = \frac{3 \times 180^{\circ}}{2} = 270^{\circ}$$

Some important conversions

$$> 1 \, rev = 360^\circ = 2\pi \, rad$$

$$> 1 \, rad = 57.3^{\circ}$$

$$> 30^{\circ} = \frac{\pi}{6} rad = \frac{1}{12} rev$$

>
$$45^{\circ} = \frac{\pi}{4} rad = \frac{1}{8} rev$$

$$> 60^\circ = \frac{\pi}{3} \ rad = \frac{1}{6} \ rev$$

$$90^{\circ} = \frac{\pi}{2} rad = \frac{1}{4} rev$$

>
$$180^{\circ} = \pi \, rad = \frac{1}{2} \, rev$$

Example1: if a body covers three revolutions in 5seconds then its | Solution: angular displacement in SI units will be

 $(a)\frac{3\pi}{2}$ rad $(a)\frac{6\pi}{5}$ rad

(a) 2π rad

 $(a)^{\frac{\pi}{2}}$ rad

- (a) 3π rad
- (a) 6π rad
- (a) 9π rad

(a) 2π rad

Example2: Angle subtended by minute hand of the clock in 15 minutes

 $3 \text{ rev} = 3 \times 2\pi \text{ rad}$ $=6\pi \text{ rad}$

Solution:

Angle in $15min. = 90^{\circ}$

$$=\frac{\pi}{2}$$
 rad

NMDCAT PREP BOOK

By AZHAR IQBAL0336-7098894

ANGULAR VELOCITY:

Rate of change of angular displacement of body is called its angular velocity.

total angular displacement total time

$$\omega = \frac{\Delta \theta}{\Delta t}$$

Example 1: if a body covers three revolutions in 6 seconds then Solution: $\omega = \frac{\Delta \theta}{\Delta t}$ its angular velocity in SI units will be

(a)
$$2\pi$$
 rad

UNIT 03

(a) 4π rad

olutions in 6 seconds then
(a)
$$6\pi$$
 rad
(b) Solution: $\omega = \frac{\Delta\theta}{\Delta t}$

$$= \frac{3 \times 2\pi}{6} = \pi$$

- > SI unit of angular velocity is $rads^{-1}$ and other units are $degs^{-1}$ and $revs^{-1}$ etc.
- > Angular velocity is a vector quantity and its direction is along axis of rotation determined by right hand rule.
- Angular displacement and angular velocity are always parallel.

Relation with time period

$$\omega = \frac{2\pi \, rac}{T}$$

(اگر کی Rotating بائی کانائم پرید معلوم ہو تواس relation سعلوم کریں)

Angular velocity of second hand of clock	$\omega = \frac{2\pi rad}{1 min} = \frac{2\pi rad}{60 sec}$
Angular velocity of minute hand of clock	$\omega = \frac{2\pi rad}{60 min} = \frac{2\pi rad}{3600 sec}$
Angular velocity of hour hand of clock	$\omega = \frac{2\pi rad}{12 \times 60 min} = \frac{2\pi rad}{12 \times 3600 sec}$
Angular velocity of earth around its own axis	$\omega = \frac{2\pi rad}{1 day} = \frac{2\pi rad}{24 h}$
Angular velocity of earth around the sun	$\omega = \frac{2\pi rad}{1 year}$

MDCAT PREP BOOK

Zayan Publisher

Zavan Publisher

Uniform Angular Velocity:

If body covers equal angular displacement in equal intervals of time then body is rotating with uniform angular velocity.

Instantaneous Angular velocity:

Angular velocity of a body at any particular instant of time is called instantaneous angular velocity.

 $\omega = \lim_{\Delta t \to 0} \frac{1}{\Delta t}$

ANGULAR ACCELERATION

Rate of change of angular velocity of a body is called angular acceleration.

$$\alpha_{av} = \frac{Total\ change\ in\ angular\ velocity}{Total\ time}$$

$$\alpha_{av} = \frac{\Delta\omega}{\Delta t} = \frac{\omega_{f} - \omega_{i}}{t}$$

- > Angular acceleration is a vector quantity and its direction is always along the direction of direction of torque.
- ➤ SI unit of angular acceleration is rads⁻² and other units are degs-2 and revs-2

Angular acceleration کامطلب ے کہ باڈی کی ہر بیکنڈ میں کتی Angular velocity بڑھ رہی ہے۔

Linear acceleration is caused by force, similarly angular acceleration is caused by torque

 $\tau = I\alpha$

Uniform Angular Acceleration:

If angular velocity of a body changes equally in equal intervals of time then body is moving with uniform angular acceleration.

Instantaneous Angular Acceleration:

Angular acceleration of a body at any particular instant of time is called instantaneous angular acceleration.

 $\alpha_{ins} = \lim_{\Delta t \to 0} \overline{\Delta t}$

If angular	velocity is
increasing	then angular
	on is positive and
	angular velocity
14	φw

If angular velocity is decreasing then acceleration is negative and anti-parallel to angular velocity.

If angular velocity is constant then angular acceleration is zero and net torque acting on the body is also zero

If w is constant

MDCAT PREP BOOK

By AZHAR IQBAL0336-7098894

Note: A body moving in a circular path may have:

- Tangential acceleration (due to changing speed of the
- Angular acceleration (due to changing angular velocity of the body).
- Centripetal acceleration (due to changing direction of linear velocity of the body).
- iv. a_t , a_c and α are always mutually perpendicular.

If body is moving in circular path with uniform speed or uniform angular velocity then body has only centripetal acceleration due to changing direction of velocity and $\alpha = 0$ and $a_t = 0$

RELATION BETWEEN LINEAR AND ANGULAR VARIABLES

i.
$$S = r\theta$$

ii.
$$\mathbf{v}_t = r\boldsymbol{\omega}$$
 or $\vec{\mathbf{v}}_t = \vec{r} \times \boldsymbol{\overline{\omega}}$

 $\mathbf{v}_t = r\omega$ or $\vec{\mathbf{v}}_t = \vec{r} \times \vec{\omega}$ $(\vec{\mathbf{v}}_t, \vec{r} \text{ and } \vec{\omega} \text{ are always perpendicular to each other})$

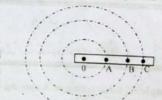

iii.
$$a_t = r\alpha$$
 or $\vec{a}_t = \vec{r} \times \vec{\alpha}$

iii. $\mathbf{a}_t = \mathbf{r}\alpha$ or $\vec{\mathbf{a}}_t = \vec{\mathbf{r}} \times \vec{\alpha}$ $(\vec{\mathbf{a}}_t, \vec{\mathbf{r}})$ and $\vec{\alpha}$ are always perpendicular to each other)

Note: For a rotating rigid body, all particles of rigid body will have same angular displacement θ , angular velocity ω and angular acceleration α but values of S, v and a_t may be different depending upon the distance r.

$$\theta_A = \theta_B = \theta_C$$
 $\omega_A = \omega_B = \omega_C$
 $\alpha_A = \alpha_B = \alpha_C$
But

 $S_C > C$
 $V_C > C$

Equations of motion for angular motion:

Equation:

$$\omega_{\rm f} = \omega_{\rm i} + \alpha t$$

П. Equation:

CENTRIPETAL FORCE

If a body is moving in a circular path then direction of its velocity is continuously changing with time. Hence there must be a force perpendicular to velocity that will change the direction of velocity.

بادی کی سپیٹریا direction کو تبدیل کرنے کے لیے force کا ہو ناضر وری ہے۔

Example: If force acting on a moving body is zero then its Path or trajectory will be

- (a) straight line (c) elliptical
- (b) circular
- (d) parabolic

Solution:

As force is zero so it will not change its direction and move in a Straight line

"Force needed to bend the normally straight path of a body into circular path is called centripetal force.

$$F_c = \frac{mv^2}{r}$$

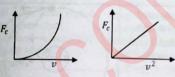

- Centripetal force is required force provided some agent to bend the body in circular path
- Direction of centripetal force is always directed towards the center but its direction is continuously changing with time.
- > Centripetal force is always perpendicular to velocity.
- Centripetal force always changes the direction of velocity it cannot change the speed of the body.

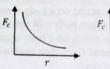

By AZHAR IQBAL0336-7098894

> Centripetal force depends upon

•	Mass of the body	$F_c \propto m$	For greater mass, greater amount of force is required to bend the body in a circular path
•	Speed of the body	$F_c \propto v^2$	With greater speed, greater amount of force is required to bend the body in a circular path
	Radius of circular path	$F_c \propto \frac{1}{r}$	greater amount of force is required to bend the body in a circular path of shorter radius

Various types of graph for centripetal force :

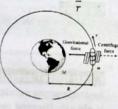

Example1:

Satellites revolving around the earth. Force of gravity provide the required centripetal force.

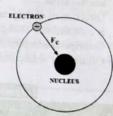

Example2:

Electrons revolving around the nucleus. Electric force provides the required centripetal force.

$$\frac{F_c = F_e}{mv^2} = \frac{Kq_1q_2}{r^2}$$

Example3:

A stone tied to a string moving in circular path. Tension in string provide required centripetal force.

$$Fc = T$$

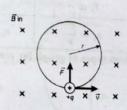

Example4: A charge moving in circular path in a magnetic field. Magnetic field force provides the required centripetal force.

$$F_{m} = F_{c}$$

$$qvB = \frac{mv^{2}}{r}$$

$$v = \frac{qBr}{r}$$

Example5:

A car moving in circular road. Force of friction provides the required centripetal force.

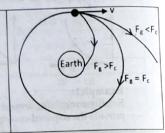

Banked tracks are needed for turns that are taken so quickly that friction alone cannot provide required centripetal force

Case i. If force acting on a body is equal to required centripetal force then body will move in circular path.

Case ii. If force acting on a body is greater than required centripetal force then body will fall towards the center of the circle.

Case iii. If force acting on a body is less than the required centripetal force then body will move out of circular.

Centripetal acceleration:

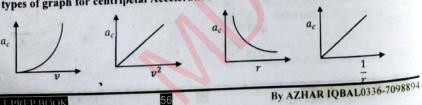

Instantaneous acceleration of the body moving in a circular path with uniform speed is always directed towards the center of the circle. It is known as centripetal

- Direction of centripetal acceleration is always directed towards the center but its direction is continuously changing with time.
- > Centripetal acceleration is always perpendicular to velocity.
- Centripetal acceleration is due to changing the direction of velocity.

Important Expressions for Centripetal Force

	In terns if angular speed	In terms of time period	In terms of momentum	In terms of K.E
$F_c = \frac{mv^2}{r}$ If $v = constant$	$F_c = mr\omega^2$ If $\omega = constant$ $F_c \propto r$	$F_c = \frac{4\pi^2 mr}{T^2}$	$F_c = \frac{p^2}{mr}$	$F_c = \frac{2K.E}{r}$
$a_c = \frac{v^2}{r}$	$a_c = r\omega^2$	$a_c = \frac{4\pi^2 r}{T^2}$	$a_c = \frac{P^2}{m^2 r}$	$a_c = \frac{2K.E}{mr}$

Various types of graph for centripetal Acceleration:

Constant quantities

UNIT 03

Under the action of only

centripetal force following quantities remains constant

Speed, kinetic energy, angular speed time period angular momentum. magnitude of velocity and magnitude of linear momentum

Quantities which are zero

Under the action of only centripetal force following quantities remains zero. Work done, change in kinetic energy, tangential acceleration, angular acceleration, tangential force, torque produced by centripetal force, change in angular velocity and change in angular momentum.

Quantities which are changing direction

Under the action of only centripetal force magnitude of following remain constant but their direction changes velocity acceleration. momentum and force.

ORBITAL VELOCITY

Minimum velocity required to put a satellite in a circular orbit is called orbital velocity.

$$\frac{F_c = F_g}{\frac{\text{mv}^2}{r}} = \frac{\text{GMm}}{r^2}$$

$$v = \sqrt{\frac{GM}{r}}$$

Note: $\mathbf{v} \propto \frac{1}{\sqrt{r}}$ and independent of mass of

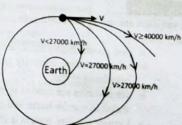

> If satellite is revolving around the earth near its surface then r = R

$$v = \frac{GM}{R} = \sqrt{gR} = 7.9 \text{ km/s}$$

and $T = 5060 sec \approx 84 min$

Minimum height of satellite revolving around the earth is 400 km and 24 such satellites form GPS system.

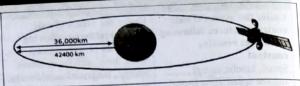

- > If velocity of satellite is less than critical velocity (v < 27000km/h) it will fall towards earth.
- If velocity is equal to critical velocity (v =27000km/h) then it will move in circular path.
- If velocity is greater than critical velocity but less than escape velocity it will move in an elliptical path.
- If velocity is equal or greater than escape velocity it will escape from earth's gravity

AT PRITE BOOK

GEOSTATIONARY SATELLITE

"Satellite whose orbital motion is synchronized with the rotation of earth is known as geostationary satellite. And its orbit is known as geostationary orbit".

Orbital speed	Radius of orbit	Height	
$v = \sqrt{\frac{GM}{r}}$ $v = 3.1 km/s$	$r = \left(\frac{GMT^2}{4\pi^2}\right)^{\frac{1}{3}}$	h = r - R	
		h ≈ 36000 km	
	$v = 4.23 \times 10^4 \ km$	veholistication of the	

Time period	Angular velocity	Angular acceleratio
T	$\omega = \frac{2\pi}{T}$	$\alpha = \frac{\Delta \omega}{\Delta t}$
T = 1day = 24h = 86400 sec	$\omega = \frac{1 rev}{day}$ $= \frac{2\pi rad}{day}$	Zero

Such satellites are useful for worldwide communication, weather observation, navigation and military uses.

- > One geostationary satellite can cover 120° longitude of earth.
- > Minimum three correctly positioned satellites are required for complete coverage of
- ➤ Microwaves are used to communicate with geostationary satellites because they travel in narrow beam and pass easily through atmosphere.
- ➤ Largest satellite system is INTELSAT (International Telecommunication Satellite Organization) managed by 126 countries.
- > INTELSAT IV has capacity of 30,000 two way telephone calls plus 3 T.V channels and its operates at 4,6,11 and 14 GHz frequencies.

OSCILLATIONS & WAVES

OSCILLATIONS

Periodic Motion:

Motion which repeats itself after regular intervals of time is called periodic motion.

Vibratory Motion:

To and fro motion of a body about its mean position is called vibratory motion.

- Motion of simple pendulum.
- Motion of mass spring system.
- Motion of tuning fork.
- Motion of atoms in solids.

Amplitude:

Maximum displacement covered by body from its mean position is called amplitude.

Vibration:

One complete round trip of a body in motion is called one vibration.

Time period:

Time taken by body to complete one vibration is called time period.

Frequency:

Number of vibrations executed by a body in one second is called frequency.

$$f = \frac{1}{T}$$

Product of time period and frequency is always equal to one

Angular Frequency:

Number of revolutions executed by a body in one second is called angular frequency.

$$\omega = \frac{2\pi}{T}$$

$$\omega = 2\pi f$$

Example: Angular frequency of second pendulum is

(a) $2\pi \, rev \, s^{-1}$

(c) π Hz

- (b) $2\pi Hz$
- (d) $2\pi \, rad \, s^{-1}$

Solution: As time period of simple pendulum is 2sec

$$\omega = \frac{2\pi}{2} = \pi rad \, s^{-1}$$

$$sin\theta = \frac{x}{x_o}$$

$$x = x_o \sin\theta$$

Types of Questions:

1. Find displacement when θ is given OR Find $\theta(phase)$ when displacement is given.

Example1:

What is displacement of a body executing SHM when its phase is $\frac{\pi}{r}$ rad.

$$(a)\frac{x_a}{2}$$

$$(b)\frac{x_o}{\sqrt{2}}$$

(a)
$$\frac{x_o}{2}$$
 (b) $\frac{x_o}{\sqrt{2}}$ (a) $\frac{\sqrt{3}x_o}{2}$ (d) x_o

$$(d)x_o$$

$$x = x_o \sin\theta$$

$$x = x_o \sin\frac{\pi}{6} = x_o \sin 30^o$$

$$= \frac{x_o}{2}$$

Example2:

If a body is executing SHM then find the value of θ for which displacement is 70% of maximum displacement. (a)30° (b) 45° (c) 60° (d) 70°

Solution:

$$x = x_o \sin \theta x = 0.7x_o = \frac{x_o}{\sqrt{2}}$$

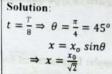

$$\Rightarrow \sin \theta = \frac{1}{\sqrt{2}}$$

$$\Rightarrow \theta = 45^o = \frac{\pi}{4} rad$$

2. Find displacement when time is given OR Find the time when displacement is given.

Example:

What is displacement of body at instant $t = \frac{T}{8}$ where T is time period of the a body executing SHM. (a) 30° (b) 45° (c) 60°

Alternate Solution

$$x = x_o \sin\theta = x_o \sin\omega t = x_o \sin\frac{2\pi}{T} \times \left(\frac{T}{8}\right)$$
$$= x_o \sin\frac{\pi}{4} = x_o \sin45^o$$
$$= \frac{x_o}{\sqrt{2}}$$

By AZHAR IQBAL 0336-7098894

SIMPLE HARMONIC MOTION

Simple harmonic motion has following characteristics:

Distance

Xo

 $2x_o$

 $3x_n$

4xo

- Always vibratory motion.
- Acceleration is always directly proportional to displacement.
- Acceleration is always directed towards mean position.

Note

Time taken

3T

4

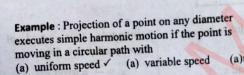

The graph between acceleration and displacement is a straight line in II and IV quadrant.

Examples:

Mass spring system executes SHM. Simple pendulum is executing SHM for small amplitude.

SHM & UNIFORM CIRCULAR MOTION

- Mass spring system executes SHM with amplitude X_o and time period T.
- If point P is moving in circular path with uniform speed or uniform angular velocity then its periodic but not SHM.
- Projection N of the point P is oscillating on vertical axis and is executing SHM.

(a)uniform acceleration

(d) none of these

TAILURE IN

Example:

The time taken by body executing SHM from its mean position to half of its extreme position.

$$(a) \frac{T}{4}$$

$$(b) \frac{T}{6}$$

(a)
$$\frac{T}{4}$$
 (b) $\frac{T}{6}$ (c) $\frac{T}{8}$

$$(d) \frac{T}{12}$$

$$x = x_0 \sin \theta$$

$$x = \frac{x_0}{2} \Rightarrow \theta = 30^\circ = \frac{\tau}{12}$$

$$\Rightarrow t = \frac{\tau}{12}$$

Alternate Solution:

$$x = \frac{x_o}{2} \Rightarrow x_o \sin\theta = \frac{x_o}{2} \Rightarrow \theta = \frac{\pi}{6}$$

$$\Rightarrow \omega t = \frac{\pi}{6} \Rightarrow \frac{2\pi}{T} t = \frac{\pi}{6} \Rightarrow t = \frac{T}{12}$$

$$t = \frac{T}{12}$$

$$t = \frac{T}{12}$$

$$t = \frac{T}{12}$$

SHORT CUT

Example:

The time taken by body executing SHM from its extreme position to a point midway between mean and extreme position. (a) $\frac{T}{4}$ (b) $\frac{T}{6}$ (c) $\frac{T}{8}$ (d) $\frac{T}{12}$

$$(a) \frac{T}{4}$$

$$\frac{T}{6}$$

$$(c)\frac{T}{8}$$

$$(d) \frac{T}{12}$$

$$x = x_0 \cos \theta$$

$$x = \frac{x_0}{2} \Rightarrow \theta = 60^{\circ} = \frac{\pi}{3}$$

$$\Rightarrow t = \frac{T}{6}$$

Alternate Solution:

$$x = \frac{x_o}{2} \Rightarrow x_o \sin\theta = \frac{x_o}{2} \Rightarrow \theta = \frac{\pi}{6}$$

$$\Rightarrow \omega t = \frac{\pi}{6} \Rightarrow \frac{2\pi}{7} t = \frac{\pi}{6} \Rightarrow t = \frac{T}{12}$$

When motion starts from extreme position then use the relation

$$x = x_o \cos\theta$$

3. Comparison type questions.

$$x = x \sin(\omega t + \phi)$$
Amplitude Angular Initial frequency phase

Example: Displacement for a body executing SHM is given as $x = 10 \sin(4t)$

Find amplitude, maximum velocity, maximum acceleration, angular frequency, time period,

frequency and initial phase.

Compare the equation $x = 10 \sin(4t)$ with standard equation $x = x_0 \sin(\omega t + \phi)$

Amplitude = $x_o = 10$

Maximum velocity = $x_0 \omega = (10)(4) = 40$

Time period = $T = \frac{2\pi}{\alpha} = \frac{\pi}{2}$

Max. acceleration = $x_0 \omega^2 = (10)(4)^2 = 160$

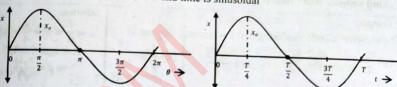

Angular frequency = $\omega = 4$

Initial phase = 0

Frequency = $f = \frac{1}{T} =$

By AZHAR IQBAL 0336-7098894

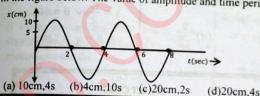

Graph: The graph between x and θ , or x and time is sinusoidal

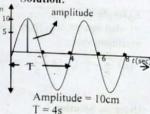

Example:

UNIT 04

Displacement time graph of a body executing SHM is shown x(cm in the figure below. The value of amplitude and time period is

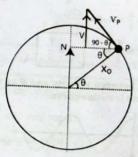

Instantaneous Velocity:

Velocity of point P is always directed along tangent to the circle and ventricle component of its velocity is the velocity of projection which is executing SHM. From the figure:

Types of Questions:

1. Find velocity when θ is given OR find θ when velocity is given.

Example:

What is velocity of the body executing SHM when its phase angle is 30°.

$$(a)\frac{v_o}{2}$$

(b)
$$\frac{v_0}{\sqrt{2}}$$

(b) 45°

$$(c) \frac{v_o \sqrt{v_o}}{2}$$

 $(c) 60^{\circ}$

$$(d) \frac{v_o}{\sqrt{3}}$$

(d) 90°

$v = x_0 \omega \cos \theta$

(a)
$$\frac{v_o}{2}$$
 (b) $\frac{v_o}{\sqrt{2}}$ (c) $\frac{v_o\sqrt{3}}{2}$ (d) $\frac{v_o}{\sqrt{3}}$ $=\frac{x_o\omega\sqrt{3}}{2} = \frac{v_o\sqrt{3}}{2}$

Example:

The value of θ for which velocity of a body executing SHM is (a)30°

MDCAT PREP BOO!

Solution

Solution:

$$v = x_0 \omega \cos\theta$$
$$v = \frac{v_0}{2} \Rightarrow \theta = 60^\circ = \frac{\pi}{3}$$

2. Find velocity when time is given OR find time when velocity is given.

Example:

The velocity of body executing SHM at instant $t = \frac{T}{R} sec$

$$(a)\frac{v_o}{2}$$

(b)
$$\frac{v_o}{\sqrt{2}}$$

$$(c) \frac{v_o \sqrt{3}}{2}$$

$$=\frac{1}{8}\sec^2 d$$

Example:
The velocity of body executing SHM at instant
$$t = \frac{T}{8}sec$$

$$(a) \frac{v_o}{2} \qquad (b) \frac{v_o}{\sqrt{2}} \qquad (c) \frac{v_o\sqrt{3}}{2} \qquad (d) \frac{v_o}{\sqrt{3}}$$

$$\Rightarrow v = \frac{x_o\omega \cos 45^\circ}{\sqrt{2}}$$

Example:

At what instant velocity of a body executing SHM is half of its maximum value.

$$(a) \frac{T}{4}$$

$$(b) \frac{T}{6}$$

$$(c)\frac{T}{8}$$

$$(d) \frac{T}{12}$$

Example:
At what instant velocity of a body executing SHM is half of its naximum value.
(a)
$$\frac{T}{4}$$
 (b) $\frac{T}{6}$ (c) $\frac{T}{8}$ (d) $\frac{T}{12}$ Solution:
 $v = x_0 \omega \cos \theta$
 $v = \frac{v_0}{2} \Rightarrow \theta = 60^\circ$

$$\Rightarrow \theta = \frac{\pi}{3} \Rightarrow t = \frac{T}{6}$$

Alternate Solution

$$v = \frac{v_o}{2} \Rightarrow v_o \cos\theta = \frac{v_o}{2} \Rightarrow \cos\theta = \frac{1}{2}$$
$$\Rightarrow \theta = \frac{\pi}{3} \Rightarrow \omega t = \frac{\pi}{3}$$

$$\Rightarrow \frac{2\pi}{T}t = \frac{\pi}{3} \Rightarrow \qquad \boxed{t = \frac{T}{6}}$$

SHORT CUT

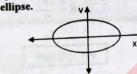

Time _ θ و بلیو معلوم کرنے کیلئے π کی جگد T اور ینچ والی و بلیو کو double کر دی۔

Time _ θ کی و بلیو معلوم کرنے کیلئے T کی جگد π اور ینچے والی و بلیو کو half کر دی۔

Graph between velocity and θ or velocity and time is cosine curve.

Graph between velocity and displacement is an ellipse.

3. Comparison type questions.

$$v = v_{\rho} \cos(\omega t + \phi)$$
Max
Velocity
Angular Initial
frequency phase

Example: velocity a body executing SHM is given as $v = 10 \cos 2t$. Find amplitude, maximum velocity, maximum acceleration, angular frequency, time period, frequency and initial phase. compare the equation $v = 10 \cos 2t$ with the standard equation $v = v_0 \cos \psi + \phi$

Solution: compare the equation :	ii. $\omega = 2$
i. $v_o = 10$	iv. $a_0 = x_0 \omega^2 = 5(2)^2 = 20$
iii. $x_o = \frac{v_o}{\omega} = \frac{10}{2} = 5$	m 1 _ 1
$T = \frac{2\pi}{3} = \frac{2\pi}{3} = \pi$	$vi. T = \frac{1}{f} = \frac{1}{\pi}$

By AZHAR IQBAL 0336-7098894

4. Velocity In terms of displacement:

$$v = \omega \sqrt{x_o^2 - x^2} \qquad = \omega \sqrt{x_o^2 - \frac{x^2 x_o^2}{x_o^2}}$$

$$v = x_o \omega \sqrt{1 - \frac{x^2}{x_o^2}} = v_o \sqrt{1 - \frac{x^2}{x_o^2}}$$

• At mean position
$$x = 0$$

$$\Rightarrow v = x_o \omega (maximum)$$

• At mean position
$$x = x_o$$

 $\Rightarrow v = 0 \ (minimum)$

> Speed of projection increases when it is moving towards center of the circle and its speed decreases when it is moving away from the center of circle

Example:

UNIT 04

If a body is executing SHM then at what displacement velocity is half of its maximum velocity.

$$(a)\frac{v_o}{2}$$

(b)
$$\frac{v_o}{\sqrt{2}}$$

$$(c) \frac{v_o \sqrt{3}}{2} \qquad (d) \frac{v_o}{\sqrt{3}}$$

$$(d) \frac{v_o}{\sqrt{2}}$$

$$v = \omega \sqrt{x_o^2 - x^2} \Rightarrow \frac{x_o \omega}{2} = \omega \sqrt{x_o^2 - x^2}$$

$$\Rightarrow \frac{x_o}{2} = \sqrt{x_o^2 - x^2} \Rightarrow \frac{x_o^2}{4} = (x_o^2 - x^2)$$

$$\Rightarrow x^2 = x_o^2 - \frac{x_o^2}{4} \Rightarrow x^2 = \frac{3x_o^2}{4}$$

$$x = \frac{\sqrt{3}x_o}{2}$$

Alternate short cut solution:

displacement = Velocity و displacement حدود ذیل کو آپس میں بدل ویں۔

As
$$v = \frac{v_0}{2}$$

Replace
$$v_o$$
 by x_o and vice versa.

Replace
$$\frac{1}{2}$$
 by $\frac{\sqrt{3}}{2}$ and vice versa.

Replace
$$\frac{1}{\sqrt{2}}$$
 by $\frac{1}{\sqrt{2}}$

Instantaneous Acceleration:

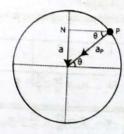

- Since point P is moving in circular path with uniform speed hence it only posses centripetal acceleration directed towards the center of the circle.
- Its vertical component is acceleration of projection N executing SHM.From the figure:

$$\sin\theta = \frac{a}{a_p}$$
 or $a = a_p$

$$\vec{a} = -\omega^2 \vec{x}$$

$$a = x_0 \omega^2 \sin \omega t$$

AIDCAT PREP BOOK

1. Find acceleration when θ is given OR find θ when acceleration is given.

Example:

Acceleration of a body executing SHM at angle 30° is (a) $\frac{\sqrt{3}a_o}{2}$ (b) $\frac{a_o}{\sqrt{2}}$ (c) $\frac{a_o}{2}$

$$(a)\frac{\sqrt{3}a_o}{2}$$

$$\frac{a_o}{\sqrt{2}}$$

$$(d) a$$

Solution:

$$a = x_0 \omega^2 \sin 30^\circ$$

$$a = \frac{x_0 \omega^2}{2} = \frac{a_0}{2}$$

Example:

For which of θ acceleration of a body executing SHM is $\frac{x_0\omega^2}{\sqrt{2}}$

For which of
$$\theta$$
 acceleration of a body executing STATES (a)30° (b) 45° (c) 60° (d) 90°

2. Find time when acceleration is given and vice versa. Example:

Acceleration of a body executing SHM at instant
$$t = \frac{T}{6}$$
 is
$$\sqrt{3}a_0 \qquad (b) \frac{a_0}{a_0} \qquad (c) \frac{a_0}{2} \qquad (d) a_0$$

$$\frac{a_o}{\sqrt{2}}$$

$$(c)\,\frac{a_o}{2}$$

Acceleration of a body executing of the distribution
$$\frac{a_0}{2}$$
 (a) $\frac{\sqrt{3}a_0}{2}$ (b) $\frac{a_0}{\sqrt{2}}$ (c) $\frac{a_0}{2}$ (d) a_0

$$a = x_0 \omega^2 \sin \theta$$

$$a = \frac{x_0 \omega^2}{\sqrt{2}} \Rightarrow \theta = 45^\circ$$

t =
$$\frac{T}{6}$$
 $\Rightarrow \theta = \frac{\pi}{3} = 60^{\circ}$
 $a = x_0 \omega^2 \sin \theta$
 $\Rightarrow a = \frac{x_0 \omega^2 \sqrt{3}}{2} = \frac{a_0 \sqrt{3}}{2}$

At what instant the acceleration of the body is $\frac{x_0\omega^2}{2}$ or $\frac{a_0}{2}$ $(a) \frac{T}{4} \qquad (b) \frac{T}{6} \qquad (c) \frac{T}{8} \qquad (d) \frac{T}{12}$ $3 a = \frac{a_0}{2} \Rightarrow \theta = 30^{\circ}$ $= \frac{\pi}{6} \Rightarrow t = \frac{T}{12}$

$$(a)\frac{T}{4}$$

$$(b)\ \frac{T}{6}$$

$$(c)\frac{T}{8}$$

$$(d) \frac{T}{12}$$

Solution:
$$a = x_0 \omega^2 \sin \theta$$

$$=\frac{2}{6} \Rightarrow t = \frac{T}{12}$$

3. Comparison type questions:

$$a = a_{o} \sin (\omega t + \phi)$$
Max. Angular acceleration frequency phase

Example: acceleration of a body executing SHM is given as $a = 8 \sin 2t$. Find amplitude, maximum velocity, maximum acceleration, angular frequency, time period, frequency and initial phase.

Compare the equation $a = 8 \sin 2t$ with the standard equation $a = a_0 \sin(\omega t + \phi)$

i. $a_0 = 8$	ii. $\omega = 2$
iii. $v_o = \frac{a_o}{\omega} = \frac{8}{2} = 4$	iv. $x_o = \frac{a_o}{\omega^2} = \frac{8}{4} = 2$
$V. T = \frac{2\pi}{\omega} = \frac{2\pi}{2} = \pi$	$vi. T = \frac{1}{l} = \frac{1}{\pi}$

By AZHAR IQBAL 0336-7098894

PHASE

Angle of θ which specifies the displacement as well as direction of motion of a body executing SHM is called phase.

- o Initial phase at $t = 0 = \emptyset$
- phase during the time $t = \omega t$
- Total phase = $\omega t + \emptyset$

	1/4	1
	- 12	Ø
		1
1		/

Motion starts t = 0 from	Initial phase	Displacement	Velocity	Acceleration
	Ø	$x = x_o \sin(\omega t + \emptyset)$	$v = x_o \omega \cos(\omega t + \emptyset)$	$a = -x_o \omega^2 \sin(\omega t + \emptyset)$
Mean position	Ø = 0	$x = x_o sin\omega t$	$v = x_o \omega cos \omega t$	$a = -x_o \omega^2 \sin \omega t$
Extreme position	Ø = 90°	$x = x_o cos \omega t$	$x = -x_o sin\omega t$	$a = -x_o \omega^2 \cos \omega t$

UNIT 04

- Phase difference between displacement and velocity is 90°.
- Phase difference between velocity and acceleration is 90°.
- Phase difference between displacement and acceleration is 180°.

MASS SPRING SYSTEM

- Mass spring system executes simple harmonic motion.
- Restoring force brings the body back towards mean position.
- Body does not come to rest at mean position due to inertia.

Hooke's Law: Applied force is directly proportional to extension produced in spring.

 $F \propto x$

- > The graph between force and extension is a straight
- Slope of the graph represents the spring constant. Area under force-extension graph represents the work done or P.E.

ال جر كراف spring constant لادع الكل islope في الدوية ドルシシwork done LP.ECいしまれい」iArea きというしゃ .2

AIDCAT PREP BOO

 $K = slope = Tan\theta$

 $\frac{K_1}{K_2} = \frac{Tan30^\circ}{Tan60^\circ}$

 $(W_1 > W_2)$

 $K = \frac{F}{x} = \frac{30N}{15cm}$

 $=\frac{30N}{15\times10^{-2}m}=200\ Nm^{-1}$

W = Area

 $=\frac{1}{2}(15\times10^{-2})(30)=2.25$ J

Example:

Force-extension graph for two different springs is shown in the figure below. Find the ratio between their spring constants.

 $(a)1:\sqrt{3}$

 $(b)\sqrt{3}:1$

(d)3:1

Example:

Force-extension graph for two different springs is shown in the figure below. In which case more work is done.

(a) 1st

(b) 2nd

(c)same

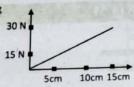

(d) zero in both

Solution:

Solution:

Solution:

Example: Force-extension graph for a spring is shown in the figure below. The value of spring constant and P.E stored in the spring

Spring Constant or Force constant

Ratio of applied force to extension produced in spring is known as spring constant.

$$K = \frac{F_{ext}}{x}$$

$$\Rightarrow \text{ SI unit} = Nm^{-1} = kgms^{-2}$$

 Spring constant and surface tension have same units.

Spring constant depends upon temperature and nature of the material.

Spring constant is independent of applied force and extension produced in spring.

Example: A mass of 5kg suspended with a vertical spring produces 2cm extension in the spring. The spring constant of the spring will be

(a) 500 Nm⁻¹

(b) 5000 Nm⁻¹ (c) 2500 Nm⁻¹ (d)250Nm⁻¹

Solution:

$$k = \frac{F}{x}$$

$$= \frac{mg}{x} = \frac{5 \times 10}{2 \times 10^{-2}} = 2500 \text{ Nm}^{-1}$$

By AZHAR IQBAL 0336-7098894

Series Combination of Springs

If springs are connected end to end this combination is known as series combination

Equivalent Spring Constant

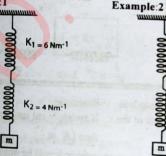

$$1. K_{eq} = \frac{K}{n}$$

UNIT 04

2.
$$K_{eq} = \frac{K_1 K_2}{K_1 + K_2} = \frac{Product}{sum}$$

3.
$$\frac{1}{\kappa_{eq}} = \frac{1}{\kappa_1} + \frac{1}{\kappa_2} + \frac{1}{\kappa_3} + \cdots$$

NOTE:

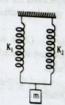

Equivalent spring constant series is less than minimum spring constant And to decrease the spring

constant springs are connected in series

Parallel Combination of Springs

If springs are connected side by side then this combination is known as parallel combination

Lotend 1/20 Ja let ce / end Lispring

パカスト

Equivalent Spring Constant

If springs are connected side by side then equivalent spring constant is given as:

- (If "n" no. of springs having same value are connected in parallel)
- 2. $K_{eq} = K_1 + K_2 + \cdots$ (If springs having different values are connected in parallel)
- 3. $K_{eq} = K_{max}$
- 4. To increase spring constant springs are connected in parallel.

MDCAT PREP BOOK

Example1:

Example2:

Acceleration:

$$\max.acceleration = -\frac{K}{m}x$$

$$\Rightarrow a \propto -x$$

Hence mass spring system is executing simple harmonic motion.

Time Period:

As $T = \frac{2\pi}{3}$

 $T \alpha \sqrt{m}$ and $T \alpha \frac{1}{\sqrt{n}}$

Note: Time period only depends upon spring

constant and mass suspended and

independent of amplitude and gravity.

Angular Frequency:

As
$$a = -\frac{\kappa}{m}x$$

 $-\omega^2 x = -\frac{K}{m}x(\because a = -\omega^2 x)$

$$\omega = \sqrt{\frac{K}{m}}$$

Note:

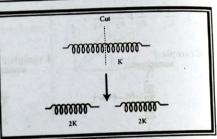

Angular frequency only depends upon spring constant and mass suspended and independent of amplitude and gravity.

Frequency:

If a spring of spring constant K is cut into 'n' equal parts then spring constant of each part will be 'nK'

Example:

If spring of spring constant K is cut into two equal parts then spring constant of each part will be 2K.

Examples: If spring is cut into two parts having length in the ratio 1:2 then the ratio between spring constants of the part will be.

- a) 1:2
- √b) 2:1
- c) 1:4
- d) 4:1

Solution:

Example3:

K = 5 N/m

If spring is cut into unequal parts then $\left(K \propto \frac{1}{L}\right)$ ratio in k will be opposite to l

Restoring Force:

Force which brings the body back towards its mean position.

- > Restoring force is the force which produces acceleration
- $F_r = -F_{ext} = -Kx = -m\omega^2 x \quad (K = m\omega^2)$
- > Restoring force is always directed towards mean position and is opposite to displacement.
- > Graph between restoring force and displacement is a straight line in 2nd and 4th Quadrant.

Zavan Publishe

K = 5 N/m

Example: The graph between restoring force and displacement is shown in the figure . Slope of the graph is directly proportional to

- (a) w (b) 1/w
- (d) $1/\omega^2$

As $F_r = -m\omega^2 x$

$$slope = \frac{F_r}{x} = -m\omega$$
$$slope \propto \omega^2$$

and $f \propto \frac{1}{\sqrt{m}}$

Note: Frequency only depends upon spring constant and mass suspended and independent of amplitude and gravity.

If spring is being vertically then we may write F = mg

$$\Rightarrow Kx = mg \Rightarrow \frac{m}{K} = \frac{x}{g}$$

$$T = 2\pi \sqrt{\frac{x}{g}} \text{ and } f = \frac{1}{2\pi} \sqrt{\frac{g}{x}}$$

Since now $x \propto g$ hence time period and frequency are still independent of gravity.

Example: If a 2kg mass suspended with a vertical spring produces 10cm extension in the spring. If it is set into oscillations its time

- (a) w (b) 1/w
- (b) ω2
- (d) $1/\omega^2$

Solution: $T = 2\pi \sqrt{\frac{x}{g}}$

ADCAT PREP BOOK

Velocity:

 $v = \omega \sqrt{x_o^2 - x^2} = \sqrt{\frac{k}{m}} \sqrt{x_o^2 - x^2}$

 $= \sqrt{\frac{k}{m}(x_0^2 - x^2)} = \sqrt{\frac{k}{m}}x_0 \sqrt{1 - \frac{x^2}{x_0^2}}$

max.velocity $v_0 = x_0 \omega = x_0 \left| \frac{k}{m} \right|$

Restoring Force:

UNIT 04

The component $mgsin\theta$ brings the body back towards its mean position

$$F_r = -mgsin\theta$$

- > -ve sign indicates that it is directed towards the mean position.
- > Torque acting on pendulum is mglsino

 \triangleright If angle θ is very small $\Rightarrow \sin\theta \approx \theta \approx \frac{x}{e}$ $\left(\because \theta = \frac{s}{r}\right)$

 $a \propto -x$

small angular displacement $'\theta'$.

Simple pendulum executes SHM for

Acceleration

 $ma = -mgsin\theta$ $a = -gsin\theta$

If pendulum makes an angle θ with the horizontal instead of vertical then

Tension in string is

$$T = mgcos\theta$$

Restoring force is

$$F_r = -mgcos\theta$$

SIMPLE PENDULUM

Simple pendulum consists of small heavy mass suspended with a light and intensible string whose other end is fixed with rigid support.

- ℓ = length of pendulum
- θ = Angular displacement with vertical axis
- s = distance from mean position
- x = displacement from mean position

Displacement:

 $x = x_0 \sin \omega t$

 $\Rightarrow x = x_o \sin \left| \frac{K}{m} t \right|$

 $max.displacement = x_0$

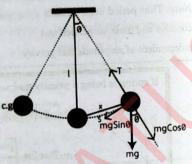

Instantaneous displacement for mass

spring system is given as

mg = weight

 $mgcos\theta$ = component along the string

 $mgsin\theta$ = component perpendicular to the string

Tension in String:

Since no acceleration is produced along the string hence net force along the string is zero.

$$T - mgcos\theta = 0$$

$$T = mgcos\theta$$

- At mean position ($\theta = 0$) tension is maximum and equal to weight $T = mg\cos = mg$
- \triangleright At extreme position ($\theta = maximum$) Tension is maximum.
- ▶ If angular displacement θ is very small then $\cos\theta \approx 1$ and $T \approx \text{mg} \approx \text{constant}$.

Angular Frequency:

$$a = -g\frac{x}{\ell}$$
$$-\omega^2 x = \frac{g}{\ell} x \Rightarrow \omega^2 = \frac{g}{\ell}$$

$$\omega = \sqrt{\frac{g}{\ell}}$$

$$\omega \propto \sqrt{g}$$
 and $\omega \propto \frac{1}{\sqrt{\ell}}$

Note:

- (i) Angular frequency only depends upon length of pendulum and acceleration due to gravity.
- (ii) It is independent of amplitude and mass of the bob.

Time Period

OR

 $\Rightarrow T \propto \sqrt{\ell}$ and $T \propto \frac{1}{\sqrt{n}}$

- T only depends upon length and acceleration due to gravity.
- T is independent of amplitude and mass of the body.

Frequency:

 $T \propto \sqrt{g}$

Note:

- Frequency only depends upon length and acceleration due to gravity.
- Frequency is independent of amplitude and mass of the body.

OCAT PREP BOOK

Second Pendulum:

A pendulum whose time period is two seconds is called second pendulum. $f = 0.5 \, Hz$, $\ell = 99.3 \, cm$ (when $a = 9.8 ms^{-2}$)

Example1: If time period of second pendulum on surface | Solution: Two second of earth is two seconds. Then time period of second pendulum on surface of moon will be

(a) 2sec

(b) $2\sqrt{6}$ sec (c) $2/\sqrt{6}$ sec (d) infinity

Example2:

If time period of second pendulum on earth is two seconds and it is shifted to moon then its time period will (value of $g_{moon} = \frac{g_{eart h}}{6}$)

(a) 2sec (b) $2\sqrt{6}$ sec (c) $2/\sqrt{6}$ sec (d)infinity

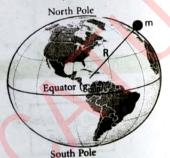

As $g' = \frac{g}{6} \Rightarrow T' = \sqrt{6}T = 2\sqrt{6}s$

اگر pendulum کو کسی ایسی جگه shift کیا جائے جہاں 'g' کی دیلیو مختلف ہو تو اس pendulum کا ٹائم پریڈ بحی change وائے گا

VARIATION IN VALUE OF 'g'

On surface of earth

- > Expression for 'g' on the surface of earth is
- > At poles value of g is maximum due to shorter distance from center of earth and value of g is independent of rotation of earth.
- \triangleright At equator value of g is maximum due to longer distance from center of earth and due to rotation of earth. (value of g varies inversely with rotation of earth. If angular velocity of earth increases value of g decreases and vice versa).
- > By moving from poles to equator value of 'g'
- > By moving from equator to pole value of 'g'

ENERGY CONVERSION IN SHM

> If a body is executing SHM then P.E and K.E interchanges into each other but total amount of energy always remains constant.

Work done:

- > In stretching the spring work is done by variable force.
- > Expressions for work done.

i.
$$W = \frac{1}{2}Fx$$

ii.
$$W = \frac{1}{2}kx^2$$

iii.
$$W = \frac{F^2}{2k}$$

iii.
$$W = \frac{F^2}{2k}$$

Questions مِن وَى كُنّ information كُود يَجَعَ بوع Questions -1 Sdecide

Example1:

If two different springs are subjected to same amount of force and the ratio between their extensions is 1:2 then the ratio between the work done will be.

- (a) 1:2
- (b) 2:1
- (c) 1:4
- (d) 4:1

Solution:

 $W \propto x \quad (F = constant)$ So ratio between work is 1:2

Example 2:

To produce 2cm extension in the spring 5J work is done on it. How much work is required to produce 4cm extension? (b) 10J (c) 20J (d) 40J

- (a) 5J

Solution:

$$W = \frac{1}{2}kx^2 \implies$$

$$W \propto x^2 \ (k = constant)$$
Since extension is doubled so work becomes 4 times $W = 4(5) = 20$

By AZHAR IQBAL 0336-7098894

Example3:

If 2N force is applied on a spring having spring constant 10Nm⁻¹ then work done is equal to.

- (a) 1:2
- (b) 2:1
- (c) 1:4

Solution:

$$W = \frac{F^2}{2k} = \frac{(2)^2}{2 \times 10}$$

$$= \frac{2}{10} = 0.2$$

Potential Energy:

> Since elastic force is conservative force so work done is equal to gain in P.E.

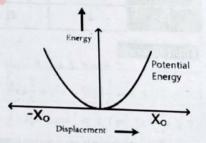

$$P.E = \frac{1}{2}Fx, \ P.E = \frac{1}{2}kx^2, \ P.E = \frac{F^2}{2k}$$

 \triangleright At mean position x = 0

$$P.E = 0 (minimum)$$

 \triangleright At extreme position $x = x_0$

$$P.E = \frac{1}{2}kx_o^2 \ (maximum)$$

Displacement	x = 0	$\frac{x_o}{2}$	$\frac{x_o}{\sqrt{2}}$	$\frac{\sqrt{3}x_o}{}$	x _o
P.E	0	$\frac{E_o}{A} = 25\%$	$\frac{E_o}{2} = 50\%$	3E ₀ - 750/	$E_o = 100\%$

Note:

P.E of horizontal mass-spring system is independent of mass of the body.

Kinetic Energy:

As
$$K.E = \frac{1}{2}mv^2$$

and
$$v = \sqrt{\frac{k}{m}} \sqrt{x_o^2 - x_o^2}$$

$$\Rightarrow K.E = \frac{1}{2}k(x_o^2 - x^2) \quad o$$

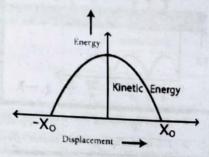

As
$$K.E = \frac{1}{2}mv^2$$
 and $v = \sqrt{\frac{k}{m}}\sqrt{x_o^2 - x}$
 $\Rightarrow K.E = \frac{1}{2}k(x_o^2 - x^2)$ or
 $K.E = \frac{1}{2}m\omega^2(x_o^2 - x^2)(\because k = m\omega^2)$
 \Rightarrow K.E depends upon spring and the second states are

- K.E depends upon spring constant amplitude and displacement.
- K.E is independent of mass of the body.
- At mean position $x = 0 \Rightarrow$

$$K.E = \frac{1}{2}kx_0^2 \ (maximum)$$

At extreme position $x = x_o \Rightarrow$ K.E = 0 (minimum)

SMDCAT PREP BOOK

WAVES

- > Wave is disturbance in a medium which transfers energy and momentum from one region of space to another.
- Wave do not transfers matter.

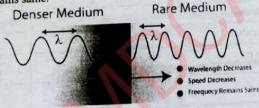

Mechanical Waves:

- > They require medium for their propagation.
- > They are produced by vibrating matter particles.
- > Water waves, waves in spring, waves in string, sound waves, ultrasound waves and infrasound waves are mechanical waves.
- > In vacuum speed of mechanical waves is zero.
- > When enter from rare to denser medium their speed and wavelength both increases but frequency remains same.

Denser Medium Rare Medium

When enter from denser to rare medium their speed and wavelength both decreases but frequency remains same.

Wave:	Electromagnetic Waves:
Sound waves	20Hz—20000Hz
Infrasound	Less than 20Hz
Ultrasound	Greater than 20000Hz

Electromagnetic Waves:

- > They do not require medium for their propagation.
- ➤ Vibrating electric and magnetic field in perpendicular direction.
- Radio waves, micro waves, infrared, visible light, ultraviolet, x-rays and γ -rays are electromagnetic waves.
- Spectrum
- > Visible light spectrum.
- ▶ In vacuum all electromagnetic waves have same speed = $3 \times 10^8 \ m/s$.
- Relation between wavelength and frequency is $f \propto \frac{1}{3}$.
- When enter from rare to denser medium their speed and wavelength both decreases but frequency remains same.

When enter from denser to rare medium their speed and wavelength both increases but frequency remains same.

In medium val

Example:

Which of following radiation will travel faster in glass

(C) Ultraviolet

(B) Visible light

(D) All have same speed

Answer: Infrared Reason:

Infrared greater wavelength than others so

v x l.

DCALPRIP BOO

Matter Waves:

- Waves associated with moving particles.
- > Matter waves were proposed by De-Broglie.
- For example De-Broglie wavelength of a particle is given as

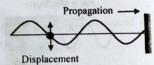

In terms of speed	In terms of momentum	In terms of energy	In terms of accelerating voltage
$\lambda = \frac{h}{mv}$	$\lambda = \frac{h}{p}$	$\lambda = \frac{h}{\sqrt{2mE}}$	$\lambda = \frac{h}{\sqrt{2meV}}$
$\lambda \propto \frac{1}{m}$ and $\lambda \propto \frac{1}{v}$	$\lambda \propto \frac{1}{p}$	$\lambda \propto \frac{1}{\sqrt{E}}$	$\lambda \propto \frac{1}{\sqrt{V}}$

PROGRESSIVE OR TRAVELLING WAVES

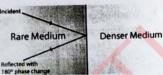

- > Waves which transfer energy by moving away from source of disturbance are called progressive waves.
- > Transverse and longitudinal waves are two types of progressive waves.

Transverse Waves:

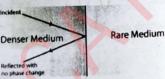

Waves in which particles of the medium are displaced in a direction perpendicular to direction of propagation.

- Water waves, waves in string and all E.M waves (radio, microwaves, IR, visible, ultraviolet, xrays, γ-rays) are transverse waves
 - > When a transverse wave travelling in rare medium is reflected from denser medium it undergo a phase change of 180°.

> When a transverse wave travelling in denser medium is reflected from rare medium no phase change occurs.

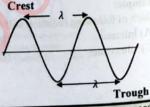

Crest:

Portion of wave in which particles are displaced above their mean position.

Trough:

Portion of wave in which particles are displaced below their mean position.

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

Wavelength:

UNIT 04

Distance between two consecutive crests or troughs is called wavelength.

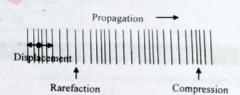

- > Transverse waves can be polarized.
- > Transverse waves can be set up only in solids, in liquids and gases they are damped out quickly.

OSCILLATIONS & WAVES

Longitudinal Waves:

Waves in which particles of the medium are displaced in a direction along the direction of propagation of waves.

Sound waves, ultrasound waves, infrasound waves and waves in spring are examples of longitudinal waves.

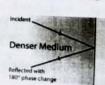

- > Compression: Portion of the wave in which density of particles is high.
- > Rarefaction: Portion of the wave in which density of particles is low.
 - > When longitudinal waves travelling in rare medium is reflected from denser medium, no phase change occurs.

Denser Medium

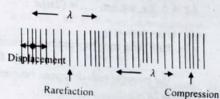

When longitudinal wave travelling in denser medium is reflected from rare medium it undergoes a phase change of 180°.

Rare Medium

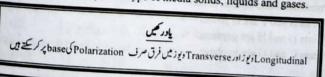

Wavelength:

Distance between consecutive compressions two consecutive rarefactions is called wavelength.

Longitudinal waves can not be polarized.

Longitudinal waves can be set up in all type of media solids, liquids and gases.

MDCAT PREP BOO

OSCILLATIONS & WAVES

Zavan Publisher

PERIODIC WAVES:

Continuous, regular and rhythmic disturbances in a medium are called periodic waves.

 \triangleright Relation $v = f\lambda$ is only applicable for periodic waves.

Speed: Distance covered by wave in one second.

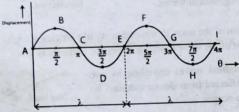

Wavelength: Distance between two consecutive points which are in phase.

Frequency: Number of waves passing through a point in one second.

$$f = \frac{number\ of\ waves}{time}$$

PHASE RELATIONSHIP BETWEEN TWO POINTS ON

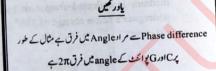

Consider a waveform shown in figure below

In phase:

- · Points having same displacements as well as same direction of motion are called in phase points.
- · Phase difference between two in phase points is even π

 $\Delta \emptyset = 0, 2\pi, 4\pi, 6\pi, \ldots = (2n)\pi$

> Path difference between two in phase points is integral multiple of λ

$$\Delta x = 0, \lambda, 2\lambda, 3\lambda, \dots = n\lambda$$

For example path difference between A and E is λ and path difference between A and I is 2\lambda

Examples:

- Points A, E and I are in phase.
- Points B and F are in phase.
- Points D and H are in phase.
- Points C and G are in phase.

By AZHAR IQBAL 0336-7098894

Out of phase:

UNIT 04

- > Points having opposite displacement or opposite direction of motion are called out of phase points.
- > Phase difference between two out of phase points is odd π

$$\Delta\emptyset=0,2\pi,4\pi,6\pi,\ldots=(2n+1)\pi$$

Example: Phase difference between B and D = $\frac{3\pi}{2} - \frac{\pi}{2} = \pi$

> Path difference between two out of phase points is integral multiple of $\frac{\lambda}{2}$

$$\Delta x = \frac{\lambda}{2}, \frac{3\lambda}{2}, \frac{5\lambda}{2}, \dots = (2n+1)\frac{\lambda}{2}$$

For example path difference between A and $C = \frac{\lambda}{2}$.

Examples:

- > Points A and C are out of phase.
- Points B and D are out of phase.

Relation between phase difference and path difference is given as

$$\Delta \emptyset = \frac{2\pi(\Delta x)}{\lambda}.$$

اگر \D افران علی علوم کوئی ایک معلوم ہو تو تو اس فار مولے ہے دوسرے کو معلوم کریں۔

Example:

Path difference between two points is $\frac{3\lambda}{4}$ then the points are:

- (a) In phase (c) Coherent
- (b) Out of Phase
- (d) Neither in phase nor out of phase

neither in phase nor out of phase Because Path difference is neither

multiple of λ nor $\frac{\lambda}{2}$.

SPEED OF SOUND

- Sound waves (pressure waves) are longitudinal waves.
- In vaccum (free space) speed of sound is
- In any medium speed of sound is given as

$$v = \sqrt{\frac{E}{\rho}}$$

- Speed of sound only depends upon two factors Modulus of elasticity of the medium
 - or compressibility of medium.

or compressibility of medium.

$$v \propto \sqrt{E}$$
 or $v \propto \frac{1}{\sqrt{compressibility}}$
 $(\because E = \frac{1}{compressibility})$

ii. Density or inertia of the continuous formula of the continu

- ii. Density or inertia of the medium.
- Speed of sound is independent of frequency, wavelength or loudness.

In solids molecules are closely spaced to each other as compared to liquids and gases that is why they respond to the disturbance more quickly as

Example:

 $E_s > E_{liq} > E_g$ So $v_s > v_{liq} > v_g$

Which of the following sound waves have greater speed in air (a) 20 Hz

(b) 10,000 Hz

(c) 20,000 Hz

(d) All have same /

MDCAT PREP BOOF

SPEED OF SOUND IN AIR

Newton's Calculations:

For calculating speed of sound in air Newton assumed that when sound waves passes through air temperature of air remains constant (isothermal process).

- > Boyle's law is applicable (PV = constant).
- > According to Newton or for isothermal process, modulus of elasticity of air is equal to pressure of air $(E = P = 1.01 \times 10^5 \text{ pa})$
- > According to Newton speed of sound in air is

$$v = \sqrt{\frac{P}{\rho}}$$
 (: E = P)
$$v = \sqrt{\frac{1.01 \times 10^5}{1.29}} = 280 \text{ m/s}$$

- > Experimental value of speed of sound in air at standard temperature (0°C) is 332 m/s.
- > There was about 16% error in Newton's calculations.

Laplace Correction:

- > Laplace pointed out that compressions and rarefactions occurs so rapidly that heat produced during the compressions is confined to the region where it is generated and does not have time to flow to the cooler region where rarefaction occurs.
- > Temperature of air does not remain constant.
- > Since no heat flow occurs so passage of sound is an adiabatic process.
- \triangleright Relation between pressure and volume is $PV^{\gamma} = constant$.
- \triangleright γ has no unit, no dimensions and $\gamma > 1$.

Monoatomic gas	Diatomic gas	Polyatomic ga
AND DESCRIPTION OF PERSONS ASSESSED.	y = 1.4	y = 1.29
$\gamma = 1.67$		

- As air is almost diatomic so for air $\gamma = 1.4$.
- According to Laplace or for adiabatic process, modulus of elasticity of air is γ times pressure of air $(E = \gamma p)$
- According to Laplace, speed of sound in air is

$$v = \sqrt{\frac{\gamma P}{\rho}}$$

$$v = \frac{1.4 \times 1.01 \times 10^5}{1.29} \approx 333 \text{ m/s}$$

MDCA'T PREP BOOF

By AZHAR IQBAL 0336-7098894

OSCILLATIONS & WAVES

Zavan Publisher

Example:

If v1 and v2 are speeds of sound in air according to Newton and Laplace calculations then which of the following is true.

(a)
$$v_1 = v_2$$
 (b) $v_1 = \sqrt{\gamma} v_2$ (c) $v_2 = \sqrt{\gamma} v_1$ (d) $v_2 = \gamma v_1$

$$(\mathbf{c})v_2 = \sqrt{\gamma}v_1$$

(d)
$$v_2 = \gamma v$$

$$\frac{v_1}{v_2} = \frac{\sqrt{\rho}}{\sqrt{\frac{\gamma P}{\rho}}} = \frac{1}{\sqrt{\rho}}$$

Solution:

$$\sqrt{\rho}$$
 $\Rightarrow v_2 = \sqrt{\gamma}v_1$

Effect of Pressure:

Since density is directly proportional the pressure $\left(\frac{P}{\rho} = constant\right)$ hence speed of sound is not effected by variation in pressure of air.

> Graph between speed of sound in air verses pressure is straight line

Example: If pressure of air is doubled then speed of sound in air will (a) Become double (b)Become √2times (c) Become half

- (d) Remain same

Effect of density:

> At constant pressure and temperature speed of sound in air is inversely proportional to root

$$v \propto \frac{1}{\sqrt{\rho}} \qquad OR \qquad \frac{v_1}{v_2} = \frac{\sqrt{\rho_2}}{\sqrt{\rho_1}}$$
where densities of ρ_2 to H in 16 .

- \triangleright Since ratio between densities of O_2 to H_2 is 16:1 hence ratio between speed of sound in
- $\Rightarrow \frac{v_{0_2}}{v_{H_2}} = \frac{1}{4} \text{ OR } \frac{v_{H_2}}{v_{0_2}} = \frac{4}{1} \text{ OR } v_{H_2} = 4v_{0_2}$

Example:

At same temperature and pressure in which of following gas speed of H₂ lowest density and (a) Ho

Effect of Temperature:

At constant pressure and temperature speed of sound increases by increasing

Reason: By increasing temperature, volume increases and density decreases so speed

At any temperature t° C the volume of gas is given as $V_t = V_o(1 + \beta t)$ Where β is coefficient of volume expansion and $\beta = \frac{1}{273}$

$$V_t = V_o \left(1 + \frac{t}{273} \right)$$

MDCAT PREP BOOK

> Speed of sound in air is directly proportional to square root of absolute temperature (Temperature in Kelvin)

$$v \propto \sqrt{T}$$
 OR $\frac{v_1}{v_2} = \sqrt{\frac{r_1}{r_2}}$ OR $T \propto v^2$

Example:

At what temperature speed of sound will become If v is doubled, Temperature should be 4double as that is at 10°C

(a) 40 °C

(b) 313°C

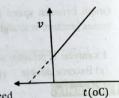

(c) 895°C

(d) 1132°C

Solution: $v \propto \sqrt{T}$ or $T \propto v^2$

$$T = 4(10 + 273) = 4(283)$$

= 1132K = 1132 - 273 = 895°C

> Speed of sound at any temperature t(°C) is given as

$$v_t = v_o + 0.61t$$

Note

If speed becomes n-times then absolute

temperature will become n^2 times $(T' = n^2T)$

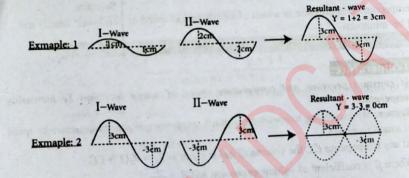

if $t \ll 273$

> With one degree or one Kelvin rise in temperature speed of sound increases by 0.61 m/s or 61 cm/s.

PRINCIPLE OF SUPERPOSITION

➤ If two or more waves are simultaneously acted on medium particle then resultant displacement of particle is algebraic sum of their individual displacements.

$$Y = Y_1 + Y_2 + \cdots + Y_n$$

By AZHAR IQBAL 0336-7098894

Three cases of Principle of Superposition

- > Interference: When two waves of same frequency and travelling in same direction superpose with each other.
- > Beats: When two waves of slightly different frequencies but travelling in same direction superpose with each other.
- > Stationary: When two waves of same frequency but travelling in opposite direction superpose with each other.

INTERFERENCE

> Superposition of two waves of same frequency and travelling in same direction results a phenomenon called interference.

Constructive Interference:

UNIT 04

Constructive interference occurs if waves are in phase and they reinforce the effect of each other.

- Phase difference = even $\pi = (2n)\pi$
- Path difference = $n\lambda$ (integral multiple of 1).
- \triangleright If A_1 and A_2 are amplitude of two waves then resultant amplitude will be $A_1 + A_2$.
- > Relation between intensity and amplitude is intensity $\propto (amplitude)^2$

Note

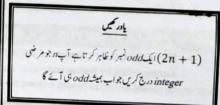

Waves having constant phase difference are called coherent waves.

Destructive Interference:

Destructive interference occurs if waves are out of phase and they cancel out the effect of each other.

- Phase difference = odd $\pi = (2n + 1)\lambda$
- Path difference = $(2n + 1)\frac{\lambda}{2}$ (odd integral multiple of $\frac{\lambda}{2}$).

Resultant amplitude will be $A_1 - A_2$.

Example 1:

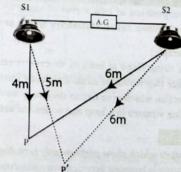

If two speakers are producing sound waves of wavelength $2m(\lambda = 2m)$ as shown in figure. If two waves have same amplitude then find resultant

displacement at point P and P'. At point P path difference between two waves is

$$\Delta S = 6m - 2m = 4m = 2(2m)$$

$$=2\lambda \quad (:: \lambda=2m)$$

Since path difference is 2λ hence 2^{nd} order maxima occur at point P.

JDCAT PREP BOOK

At point P' path difference between two waves is

$$\Delta S = 6m - 5m = 1m = \frac{\lambda}{2} (\because \lambda = 2m)$$

Since path difference is $\frac{\lambda}{2}$ hence 1st order maxima occur at point P.

Resultant displacement = A - A = 0

BEATS

- > Superposition of two waves having slightly different frequency but travelling in same direction results a phenomenon called beats.
- Beats are periodic fluctuations between maximum and minimum sound.
- \triangleright A single tuning fork produces sound waves of single frequency say f = 32 Hz
- > By loading some wax or plasticize or prongs of tuning forks its frequency decreases say $f = 30 \, Hz.$
- > If two tuning forks are sounded together beats are produced having beat frequency 2Hz = (32 - 30).
- Beat frequency is always equal to difference between the frequencies.

$$f_{beat} = f_A - f_B$$

If two sound waves of frequencies 50 Hz are travelling in same direction then Example:

$$f_{beat} = 54 - 50 = 4Hz$$

- > If beat frequency (number of beats per second) is greater than 10Hz. Beats can not be distinguished by human ear.
- > Beats are useful in tuning a string instruments.

STATIONARY WAVES

Superposition of two waves of same frequency but travelling in opposite direction results a phenomenon called stationary waves or standing waves.

Example:

If a string fixed at both of its ends is plucked from its center two waves of same frequency travels in opposite direction which give rise to stationary waves.

String vibrates in a loop and nodes and anti-nodes are formed.

Nodes:

Points which show permanently zero displacement are called nodes.

Energy is bounded between two consecutive nodes.

By AZHAR IQBAL 0336-7098894

OSCILLATIONS & WAVES

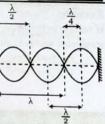

Zavan Publisher

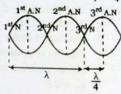

Anti-Nodes: Points which vibrating with maximum amplitude are called anti-nodes.

- > All the particles of string execute SHM except nodes.
- > Distance between two consecutive nodes is -
- > Distance between node and next anti-node is \(^{\lambda}\)
- ➤ Distance between two consecutive antinodes is -

Example:

Consider string is vibrating in three loops. What is distance between first node and third anti-node

Example:

If 12cm string is vibrating in four segments (loops) then distance between node and next anti-node will be

(a) 0.75cm

(c) 3cm

Solution: $L = 4\left(\frac{\lambda}{2}\right)$

$$4\left(\frac{\lambda}{2}\right) = 12cm$$

$$\lambda = 6cm \text{ thus}$$

= 1.5cm

STATIONARY WAVES IN STRETCHED STRING

- Waves travelling in stretched string are transverse waves.
- > If a stretched string is plucked two transverse waves travelling in opposite direction give rise to stationary waves.

(d) 6cm

Speed of Waves: Speed of transverse waves in a stretched string is given as

- o F is tension in the string
- o m is mass per unit length of string Unit of m is kgm-1

> Speed is directly proportional to square root of tension and inversely proportional to square root of mass per unit length of string.

> Speed of waves in stretched string is independent of length of string, number of loops and frequency of vibration.

AT PREP BOOK

Example:

If tension in the string becomes four time than speed of transverse waves in string will become

- (a) Four times (c) One fourth
- (b) Two times (d) One half
- Solution:

As v x VF So, speed will become two

JECK speede 255 Tension

I-mode of vibration:

If a string of length ℓ is plucked from length $\frac{\ell}{2}$ it will vibrate in single loop.

- > Number of loops formed = 1
- Number of nodes formed = 2
- > Number of Anti-nodes formed = 1
- > String vibrates with maximum wavelength i.e. $\lambda_1 = 2\ell$
- String vibrates with minimum frequency i.e. $f_1 = \frac{1}{2\ell} \sqrt{\frac{F}{m}}$
- f₁ is known as fundamental frequency, fundamental tone or I-harmonic.

Law of length	Law of tension	Law of mass
$f \propto \frac{1}{4}$	$f \propto \sqrt{F}$	$f \propto \frac{1}{\sqrt{m}}$

II mode of vibration:

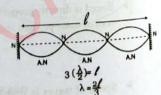

If a string is plucked from length $\frac{\ell}{4}$ it vibrates in two loops.

- ➤ Number of loops formed = 2
- Number of nodes formed = 3
- Number of Anti-nodes formed = 2
- > String vibrates with wavelength i.e. $\lambda_2 = \frac{\lambda_1}{2} = \ell$
- > String vibrates with frequency $f_2 = 2f_1$

III mode of vibration:

If a string is plucked from length $\frac{\ell}{6}$ it vibrates in two loops.

- ➤ Number of loops formed = 3
- ➤ Number of nodes formed = 4
- ➤ Number of Anti-nodes formed = 3
- String vibrates with wavelength i.e. $\lambda_3 = \frac{\lambda_1}{3} = \frac{2\ell}{3}$
- > String vibrates with frequency $f_2 = 2f_1$

By AZHAR IQBAL 0336-7098894

Harmonics:

UNIT 04

Such oscillations in which each frequency is integral multiple of fundamental frequency are called harmonics.

- > Only harmonics are produced in stretched string having frequencies $f_1, 2f_1, 3f_1, 4f_1, \dots$ and wavelength $\lambda_1, \frac{\lambda_1}{2}, \frac{\lambda_1}{3}, \frac{\lambda_1}{4}, \dots$
- > Frequencies other than harmonics are damped out quickly.

Example:

If fundamental frequency is 20Hz then which of the following frequency waves can not be produced in stretched string.

(a) 40 Hz

- (b) 60 Hz
- (c) 70 Hz (d) 80 Hz

Solution:

70 Hz is not integral multiple of 20 Hz.

nth-Harmonic:

- > String is plucked from = $\frac{\ell}{2n}$
- Number of loops formed = n
- Number of nodes formed = n + 1
- Number of antinodes formed = n

Frequency:

$$f_n = nf_1$$
 OR

$$f_1 = \frac{1}{2\ell} \sqrt{\frac{F}{m}}$$

Where
$$n=1,2,3,...$$

Wavelength:

$$\lambda_n = \frac{\lambda_1}{n}$$

$$\lambda_n = \frac{2\ell}{n}$$

Where n=1,2,3,...

Over Tones:

An overtone is any frequency among harmonic series that is greater than fundamental

Examples:

Frequency of 1^{st} overtone = $2f_1$

Frequency of 2^{nd} overtone = $3f_1$

Frequency of 3^{rd} overtone = $4f_1$

requency	f_1	$2f_1$	3f ₁	A.f.

Over tone	Fundamental tone	First	Second	Third	Fourth

MDCAT PREP BOOK

APPLICATIONS

- > Nuts on guitar are used to change the tension in string and thus change the frequency.
- > String of different mass per unit length are used to produce note of different frequencies.
- > One can move hand on the neck of guitar to change the length of string to produce note of different frequencies.

Example:

If frequency of 5th over tone is 60 Hz then frequency 2nd harmonic will be

If three consecutive frequencies of a harmonic series

given as 60 Hz, 75 Hz, 90 Hz then frequency of 1st

(a) 10 HZ (b) 20 HZ (c) 25 HZ (d) 30 HZ

Solution:

5th over tone = $6f_1 = 60$ $\Rightarrow f_1 = 10 \, Hz$

Frequency 2nd harmonic $= 2f_1 = 20 Hz$

Solution:

 $f_1 = 75 - 60 = 15 \, Hz$ Frequency of 1st over tone $= 2f_1 = 2(15) = 30 Hz$

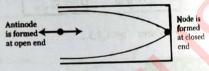

overtone will be (a) 5 HZ

Example:

(b) 15 HZ (c) 30 HZ (d) 60 HZ

STATIONARY WAVES IN AIR COLUMN

- > Longitudinal wave (sound or pressure waves) can produce stationary waves in air column.
- When we blow air in an air column then the relation between incident and reflected wave depends on whether reflecting end is open or closed
- > (i) At open end air molecules have complete freedom of motion and can vibrate with maximum displacement and thus it behave as anti node.

- > (ii) At closed end motion of air molecules is restricted and displacement of air molecules remains permanently zero thus it behave as node.
- > Although sound waves are longitudinal waves but the displacement of air molecules can be represented by a transverse wave.

Example: Which of the following mode of vibration can not be produced in air column?

(d) All of these

Reason: At open end always anti-node and at closed end always node is formed.

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

Case-I: Pipe is open at both ends

I-mode of vibration

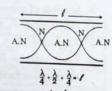

UNIT 04

Consider a pipe of length & open at both ends.

- > Number of loops formed = 1
- > Number of nodes formed = 1
- Number of anti-nodes formed = 2
- \triangleright Wavelength: $\lambda = 2\ell$ (maximum wavelength)
- > Frequency: $f_1 = \frac{v}{2e}$ (Where v is speed of sound in air)
- > fris known as fundamental frequency or fundamental harmonic or fundamental tone.

II-mode of vibration

- Number of loops formed = 2
- Number of nodes formed = 2
- Number of anti-nodes formed = 3
- Wavelength: $\lambda = \frac{\lambda_1}{2} \Rightarrow f_2 = \frac{2\ell}{2}$
- Frequency: $f_2 = 2f_1 \Rightarrow f_2 = \frac{2v}{24}$

Harmonics:

Such oscillations in which each frequency is integral multiple of fundamental frequency are called harmonics.

- > If pipe is closed at one end only odd harmonics are produced having frequencies $f_1, 3f_1, 5f_1, \dots$ and wavelength $\lambda_1, \frac{\lambda_1}{3}, \frac{\lambda_1}{5}, \dots$
- > Frequencies other than odd harmonics are damped out quickly.

Over Tones:

An overtone is any frequency among the harmonic series that is greater than fundamental

Frequency of 1st overtone = $3f_1$ Examples: Frequency of 2^{nd} overtone = $5f_1$ Frequency of 3^{rd} overtone = $7f_1$

tone

Frequency	f_1	$3f_1$	5f ₁	7f ₁	0.6
Mode of vibration	First	Second	Third	Fourth	9f ₁ Fifth
Harmonic	First	3 rd	5 th	7 th	Oth
Over tone	Fundamental	First	Second	Third	E

Note: If pipe is open at both ends, both even and odd harmonics are produced. But if pipe is closed at one end only odd harmonics are produced. So open end pipe is richer in harmonics than closed end pipe.

DOPPLER'S EFFECT

Apparent change in frequency of waves due to relative motion between source and observer is called Doppler's effect.

Doppler's effect was first observed for light coming from a distant star.

Doppler's effect is applicable for all types of waves (longitudinal or Transverse, mechanical or electromagnetic)

change" distance د observer اور source مرف تب پير ابو گاجب change" distance د change اور Frequency

(Doppler's effect is observed)

- If distance between source and observer decreases then frequency increases.
- If distance between source and observer increases then frequency decreases.
- If distance between source and observer does not change then frequency remains same and

Case-II: Pipe is open at both ends

I-mode of vibration

Consider a pipe of length ℓ open at both ends.

- Number of loops formed = $\frac{1}{2}$
- > Number of nodes formed = 1
- Number of anti-nodes formed = 1
- Wavelength: $\lambda_1 = 4\ell$ (maximum)
- Frequency: $f_1 = \frac{v}{2\ell}$ (minimum)
- \triangleright f_1 is known as fundamental frequency or fundamental harmonic or fundamental tone.

Note: Single loop is produced in closed end pipe as shown in the following figures

Because at open end always anti-nodes and at closed end always node is formed. Hence 2nd harmonic cannot be produced in closed end pipe.

Case ii:

Relative speed مرفت Achange کردامد

> If observer is moving towards the source then relative speed increases and

$$v_{rel} = v + u_o$$

where v is speed of the wave and u_0 is speed of observer.

> If observer is moving away from source then relative speed of wave decreases and

$$v_{rel} = v - u_o$$

> If observer is at rest then relative speed of wave does not change.

Case iii: (Doppler shift is produced only if source is moving)

Wave length مرفت بداء كاجر source move

> If source is moving towards the observer than apparent wavelength decreases

and
$$\lambda' = \lambda - \Delta \lambda$$

> If source is moving away from the source apparent wavelength increases

and
$$\lambda' = \lambda + \Delta \lambda$$

> If source is at rest then wavelength remains same $\lambda' = \lambda$ and $\Delta \lambda = 0$

Doppler's Shift:

Change in wavelength $\Delta\lambda$ is known as Doppler shift and

$$\Delta \lambda = \frac{u_s}{f}$$

Where u_s is speed of source and f is actual frequency Doppler's shift only depends upon two factors.

(i) Speed of source ∆ \alpha \alpha u_s

(ii) Actual Frequency Δλα 1

Example:

If two cars A and B horn the sound of same frequency while approaching an Car A observer with velocities 20 m/s and 30 m/s respectively then Doppler shift is maximum for? (a) Car A (b) Car B (c) Same for A and B (d) Zero for A and B

General relation for apparent frequency is given as

by observer I

اگر source قریب آرامون

+ve John source لكائس

1. If observer is moving towards stationary source $(u_s=0)$

-66 +ve

> Apparent frequency increases.

 \triangleright Wavelength remains same and $\Delta\lambda = 0$

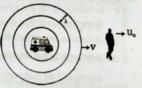

2. If observer is moving away from stationary source $(u_s=0)$

$$f' = \left(\frac{v - u_o}{v}\right) f$$

> Apparent frequency decreases.

Wavelength remains same and $\Delta \lambda = 0$

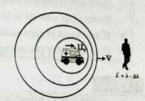

3. If source is moving towards stationary source $(u_0=0)$

$$f' = \left(\frac{v}{v - u_s}\right) f$$

> Apparent frequency increases.

 \triangleright Wavelength remains same and $\Delta \lambda = \frac{u_s}{f}$

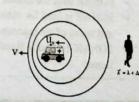

4. If source is moving away from stationary source

$$f' = \left(\frac{v}{v + u_s}\right) f$$

Apparent frequency decreases (f' < f).

 \triangleright Wavelength increases $(\lambda' > \lambda)$.

5. If source and observer are moving away from each other.

$$> f' = \left(\frac{v + u_o}{v - u_s}\right) f$$

- \triangleright Apparent frequency increases (f' > f)
- \triangleright Wavelength decreases $(\lambda' < \lambda)$

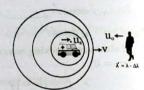

6. If source and observer are moving towards each other.

$$f' = \left(\frac{v - u_o}{v + u_s}\right) f$$

- \triangleright Apparent frequency decreases (f' < f).
- \triangleright Wavelength increases $\lambda' > \lambda$

APPLICATIONS OF DOPPLER'S EFFECT:

RADAR:

- > RADAR is an abbreviation of "radio amplification detection and ranging".
- > It uses radio waves for detection of objects.
- ightharpoonup RADAR is used to determine the range $\left(R = \frac{1}{2}ct\right)$ where c is speed of light and t is time between transmission and reception of radio signal.

- RADAR is used to determine speed of objects $(u_s = f(\Delta \lambda))$ where f is actual frequency of transmitter and $\Delta\lambda$ is Doppler's shift.
- If an object is approaching the RADAR then λ decreases.
- \triangleright If an object is preceding the RADAR then λ increases.

SONAR:

- > SONAR is an abbreviation of "sound navigation and ranging".
- > SONAR uses ultrasound waves.
- > SONAR is used for detection and to determine range and speed of submarines.
- SONAR is used to fixed sea depth and undersea mines.

HEAT AND THERMODYNAMICS

Heat: Heat is type of energy flowing due to difference in temperature of two bodies.

Temperature::

Macroscopically temperature is measure of hotness or coldness of a body.

> Microscopically temperature is measure of average K.E of molecules of a substance.

KINETIC MOLECULAR THEORY OF GASES

- > There are two evidence for kinetic molecular theory of gases.
 - (ii) Brownian motion (i) Diffusion

Postulates::

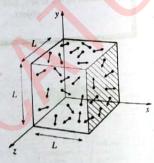

- > All gases consists of very small discrete particles called molecules.
- > Gas molecules are in state of random motion in all possible directions with different velocities.
- Molecules of gas are constantly colliding with each other and with walls of container.
- > Collision of molecules is perfectly elastic collision.
- > Molecules of gas do not exert force on each other except collision.
- > Volume occupied by gas molecules is negligible as compared to volume of gas. (volume of container).

PRESSURE OF GAS

Pressure of gas is defined as momentum transferred to walls of container per second per unit area due to continuous collisions of gas molecules with the walls of container.

- Consider N number of molecules enclosed in a cubical P box of side 'l'
- If a molecule of mass 'm' moving with velocity v1x rebounds back with same velocity (due to elastic collision). then

By AZHAR IQBAL 0336-7098894

- > Time between two consecutive collisions $\Delta t = \frac{2\ell}{2}$
- No. of collisions per second = $\frac{v_{1x}}{v_{1x}}$
- > Force exerted by molecule on the wall = thange in momentum time

$$F_{1x} = \frac{mv_{1x}^2}{\ell}$$

Total force on the wall ABCD = $F_{1x} + F_{2x} + \cdots + F_{Nx}$

$$=\frac{mv_{1x}^2}{\ell}+\frac{mv_{2x}^2}{\ell}+\cdots+\frac{mv_{Nx}^2}{\ell}$$

Pressure on the wall ABCD = $\frac{m}{\ell^3}(v_{1x}^2 + v_{2x}^2 + \dots + v_{Nx}^2)$

$$P_{x} = \frac{m\ell}{\ell^{3}} \left(\frac{v_{1x}^{2} + v_{2x}^{2} + \dots + v_{Nx}^{2}}{N} \right)$$

$$P_x = \rho < v_x^2 >$$

- **Density of gas** = $\frac{Total\ mass}{Total\ volume} = \rho = \frac{mN}{\ell^3}$
- > Average velocity = $\frac{v_{1}+v_{2}+\cdots+v_{N}}{N}$ = $\langle v \rangle$ = 0
- > Average square velocity = $\frac{v_1^2 + v_2^2 + \dots + v_N^2}{N} = \langle v^2 \rangle \neq 0$
- > Root mean square velocity = $\sqrt{\langle v^2 \rangle} = \sqrt{\frac{v_1^2 + v_2^2 + \dots + v_N^2}{N}} \neq 0$
- > Since molecules are in random motion hence $\langle v_x^2 \rangle = \langle v_y^2 \rangle = \langle v_z^2 \rangle$
- Similarly $P_y = \rho < v_y^2 > \text{and } P_z = \rho < v_z^2 >$
- > $< v^2 > = < v_x^2 > + < v_y^2 > + < v_z^2 > = 3 < v_x^2 >$ $\Rightarrow < v_x^2 > = \frac{1}{3} < v^2 > \text{ and } P = \frac{1}{3} \rho < v^2 >$
- $P_x = P_y = P_z$ (Pascal's law)
- > Net pressure on any wall of container is given as

$$P = \rho < v^2 >$$

Example: If velocity or speed of each molecule is doubled then pressure of gas will become

(a) Double(b) Half(c) Four Times \checkmark (d) Remains same

Solution: As $P \propto < v^2 >$ If v is doubled, P wil become four times.

MDCAT PREP BOOK

Example:

If average square velocity of gas molecules is doubled, pressure of gas will become

(a) Double ✓ (b) Half (c) Four Times (d) Remains same

Solution: As $P \propto < v^2 >$

If $\langle v^2 \rangle$ is doubled P will become double.

Kinetic Equation of gas

ightharpoonup Kinetic equation of gas is given as $P = \frac{1}{3}\rho < v^2 > = \frac{mN}{3V} < v^2 >$

$$\Rightarrow PV = \frac{1}{3}mN < v^2 >$$

Relation between Pressure and <K.E>

$$P = \frac{mN}{3V} < v^2 > = \frac{2N}{3V} < \frac{1}{2}mv^2 >$$

$$\Rightarrow P = \frac{2N}{3V} < K.E >$$

➤ If $\frac{N}{V} = N_o = constant \text{ then } P \propto < K.E >$

General Gas Equation:

> General gas equation for 'n' moles is given as

$$PV = nRT$$

Where R is general gas constant and in SI units $R = 8.314 \, Jmol^{-1}K^{-1}$

- ightharpoonup If n and T are constant then $P \propto \frac{1}{v}$ (Boyle's law)
- > If n and T are constant then $V \propto T$ (Charle's law)
- ≥ If P and T are constant then $V \propto n$ (Avogadro's law)
- ≥ If n and V are constant then $P \propto T$ (Lussac's law)

Boltzman Constant: (k)

The ratio of general gas constant to Avogadro's number is called Boltzmann constant.

$$k = \frac{R}{N_A} \quad \text{and } k = \frac{8.314}{6.02 \times 10^{23}} = 1.38 \times 10^{-23} J K^{-1}$$

Example: The product of Boltzmann and Avogadro's number (in SI units) is always equal to

(a) $8.314 \checkmark$ (b) 6.02×10^{23}

(c) 1.38×10^{-23} (d) one

Solution:

 $N_A \times k = R = 8.314$

Example: The ratio of unit of Boltzmann to unit of General gas constant is equal to

(a) mole

(b) $mole^{-1} \checkmark$ (c) $\int mole^{-1}$ (d) one

 $\frac{mole^{-1}K^{-1}}{JK^{-1}} = mole^{-1}$

By AZHAR IQBAL 0336-7098894

HEAT AND THERMODYNAMICS Relation between Temperature and <K.E>

> At any temperature T (Kelvin)<K.E> is given as K.E.

- > < K.E > ∝ T
- > Average K.E of molecules only depends upon temperature and independent of nature of gas.

Example: At room temperature which of the following gas molecules have greater average kinetic energy.

(a) H2

(b) CO₂ (c) N₂ (d) All have same energy

Solution:

Since temperature is same so <K.E> is also same.

Example:

UNIT 05

At temperature 27°C, average K.E of gas molecules will be

(a) 6×10^{-21} J (c) 600×10^{-21} (b) 60×10^{-21} J (d) 0.6×10^{-21} I

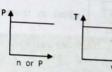

Solution: $\langle K.E \rangle = \frac{3}{2}kT$ $= \frac{3}{2}(1.38 \times 10^{-23})(300)$ $(put 3 \times 1.38 \approx 4)$ $=600 \times 10^{-23} = 6 \times 10^{-21}$

Boyle's Law:

- If number of moles of gas and temperature are kept constant then volume of gas is inversely proportional to pressure.
- $V \propto \frac{1}{p}$ (if n and T = constant)
- \triangleright PV = k(where k is constant and k = nRT)
- $P_1V_1=P_2V_2$
- Different graph for Boyle's law:

Example: If at two different constant temperatures T_1 and T_2 the graph between P and $\frac{1}{\nu}$ is shown in the figure then.

(a) $T_1 > T_2$ (c) $T_1 = T_2$ (b) $T_1 < T_2$ (d) None

Solution:

= PV = k = nRT⇒ Slope ∝ T

Slope of T_2 larger then T_1 so $T_2 > T_1$

AT PREP BOOK

105

Charle's Law

- > If number of moles of a gas and pressure are kept constant then volume of gas is directly proportional to its absolute temperature.
- $V \propto T$ (If n and P are constant)
- $\Rightarrow \frac{V_1}{T_1} = \frac{V_2}{T_2} \text{ or } V_1 T_2 = V_2 T_1$
- > Different graph for Charle's law.

$$\frac{v}{r}$$

$$\Rightarrow \frac{V}{T} = k$$
 (where k is constant and $k = \frac{nR}{P}$) as $PV = nRT \Rightarrow \frac{V}{T} = \frac{nR}{P}$

Example: If at two different constant pressures P_1 and P_2 the graph between volume and temperature of a gas is shown in the figure below then

(a)
$$P_1 > P_2$$

(b)
$$P_1 < P_2$$

(c)
$$P_1 = P_2$$

Solution:

Slope of graph =
$$\frac{V}{T} = \frac{nR}{P}$$

 $\Rightarrow Slope \propto \frac{1}{P}$
 $so P_2 > P_1$

Root mean square velocity:

> Root mean square velocity is given as $v_{rms} = \frac{v_1^2 + v_2^2 + \dots + v_N^2}{N}$

where 'm' is mass of each molecule.

- Root mean square velocity depends upon
 - 1. Temperature $(v \propto \sqrt{T})$

2. Nature of the gas $\left(v \propto \frac{1}{\sqrt{m}}\right)$.

Example: At room temperature which of the following gas molecules will have greater root mean square velocity (d) All have same energy (c) N₂

(b) CO2

Solution: Hence Since $v_{rms} \propto \frac{1}{\sqrt{m}}$ H₂ has greater v_{rms}

By AZHAR IQBAL 0336-7098894

UNIT 05

HEAT AND THERMODYNAMICS

Zayan Publisher

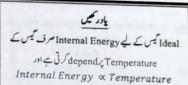

Other relations for root mean square velocity are

Internal Energy:

Sum of all forms of molecule energies (P.E and K.E) is called internal energy.

- For ideal gas molecule P.E = 0, because there is no force of attraction or repulsion between molecules.
- > If gas is mono-atomic molecules posses only translational K.E.
- ➤ If gas is diatomic or polyatomic molecules posses translational, vibrational and rotational
- ➤ Since K.E only depends upon temperature and internal energy of an ideal gas only depends upon temperature.
- > By increases temperature internal energy increases and vice versa.
- > At constant temperature (isothermal process) U = constant and $\Delta U = 0$.
- A function which only depends upon initial and final states and independent of path followed is called state function.

- ➤ Change in internal energy is a state function (i.e independent of path followed)
 - \triangleright If a system changes state (P_1, V_1) to (P_2, V_2) along two different path as shown in figure then

$$\Delta U_1 = \Delta U_2$$

Sign convensions:

Heat added to system	Heat removed from system	Work done by the system	Work done on the system	increases then	If internal energy decreases
+ve	-ve	+ve	-ve	ΔU +ve	then Δ <i>U</i> -ve

Work done in thermodynamics:

Work done at constant pressure P is

$$W = P\Delta V \text{ or } W = P(V_f - V_i)$$

- > Work done by the system is taken positive.
- Work done on the system is taken negative.
- > Area under P V graph is equal to work done.

AIDCA LPREP BOOK

107

Isothermal Process:

> Boyle's law is valid

Since T = constant, hence internal energy also remains constant and $\Delta U = 0$.

PV = constant.

> Curve representing the isothermal process is called isotherm

> Mostly process which are carried out slowly are isothermal.

Isothermal Expansion

Mechanical energy is converted into heat.

(مطلب جو mechanical energy بري ك و heat ك على يم فارئ موكي)

ightharpoonup T = Constant and $\Delta U = 0$

Work done is +ve.

First law of thermodynamics takes the form $Q = W(: \Delta U = 0)$.

A process which is carried out at constant temperature is called isothermal process.

Example: If volume V of gas increased by 200% at pressure P then the work done by the system is

(a) PV

(b) 2PV

(c) 3PV

(d) 4PV

Solution: $V_f = V + \frac{200V}{100} = 3V$ $W = P(V_f - V_i)$ = P(3V - V) = 2PV

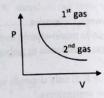

Zavan Publisher

Example: P-V graph for two gases is shown in the figure below. For same change in volume which of following option is correct.

- (a) $W_1 = W_2$
- (b) $W_1 < W_2$
- (c) $W_1 > W_2$
- (d) $W_2 > W_1$ and $W_1 = 0$

Solution: $W_1 > W_2$

Example: A system undergoes a cycle process as shown in the figure below then work done will be

(a) PV

- (b) 2PV
- (c) 3PV
- (d) 4PV

Solution:

$$W_1 = Area of triangle$$

$$= \frac{1}{2}(3P - P)(3V - V)$$

FIRST LAW OF THERMODYNAMICS

When heat Q is added to system it appears as increases in internal energy which is stored in the system plus work done by the system.

$$Q = \Delta U + W$$

Where ΔU is change in internal energy $(\Delta U = U_f - U_i)$

First law of thermodynamics is actually law of conservation of energy in thermodynamics.

Example 1: Bicycle Pump:

When we compress the air in a bicycle pump by closing its nozzle. Mechanical work is done on it. Since no heat flow occurs so this mechanical energy is converted into internal energy. Thus internal energy increases and its temperature increases.

Example 2: Metabolism:

- Energy transforming process that occurs in an organism is called metabolism.
- Energy from food we eat is stored in the body in form of internal energy.
- \triangleright By doing some mechanical work internal energy decreases. $\Delta U = Q W$

\rightarrow For isothermal process modulus of elasticity of gas is equal to pressure of the gas (E = P). Isothermal Compression

- $\Delta U = 0$ and T = Constant
- Work done is -ve.
- Heat is converted into mechanical energy. -Q = -W(مطلب جو heat م وی کے وو work کے میں استعال ہوگ)

_ Isotherm .

Adiabatic Process

A process in which no heat enters or leaves from the system Q = 0.

- > Temperature of the system may increase or decrease.
- Relation between pressure and volume is

- Curve representing the adiabatic process is called adiabat.
- Adiabat is γ times steeper than isotherm.
- First law of thermodynamics takes form $W = -\Delta U$ (: Q = 0)
- Mostly process which are carried out rapidly are adiabatic.
- For adiabatic process modulus of elasticity of gas is given as $E = \gamma P$

MOLAR SPECIFIC HEAT

Heat Capacity

Amount of heat required to raise the temperature of a substance through one Kelvin is

- called heat capacity. > It is denoted by C and
- Its SI unit is JK^{-1} and in terms of base unit is $Kgm^2s^{-2}K^{-1}$.
- > Boltzmann constant, entropy and heat capacity have same units.
- > Heat capacity depends upon two factors
 - (i) Nature of substance
- (ii) Amount of substance.

- \triangleright Heat capacity for adiabatic process is zero. (: Q = 0).
- \triangleright Heat capacity for isothermal process is infinite. (: $\Delta T = 0$)

By AZHAR IQBAL 0336-7098894

Specific Heat:

Amount of heat required to raise the temperature of 1 kg substance through one Kelvin is called specific heat.

> It is denoted by 'C' and

$$C = \frac{Q}{m\Delta T}$$

- Its SI unit is $JKg^{-1}K^{-1}$ and in terms of base units is $m^2s^{-2}K^{-1}$.
- Specific heat only depends upon nature of substance and independent of amount of substance.
- For adiabatic process $Q = 0 \Rightarrow c = \frac{Q}{Q} = 0$
- > For isothermal process $\Delta T = 0 \Rightarrow c = \frac{Q}{m\Delta T} = \infty$

Example: Ratio of specific heat of 2kg water to specific heat of 4kg is

(a) 1:1 (b) 1:2 (d) 1:4

Solution: 1:1 (specific heat is independent of amount of substance)

Molar Specific Heat:

Amount of heat required to raise the temperature of one mole substance through one Kelvin is called molar specific heat.

- It is denoted by C and
- ightharpoonup Its SI unit is $Imol^{-1}K^{-1}$
- General gas constant and molar specific heat have same units.

(c) 2:1

- > Molar specific heat only depends upon nature of substance and independent of amount of
- For adiabatic process $Q = 0 \Rightarrow C = \frac{Q}{n\Delta T} = 0$
- For isothermal process $\Delta T = 0 \Rightarrow C = \frac{Q}{n\Delta T} = \infty$

In case of solids or liquids

When solids or liquids are heated their volume approximately remains constant.

$$\Rightarrow \Delta V = 0 \text{ and } W = 0$$
$$\Rightarrow O = \Delta U$$

► Heat is entirely converted into internal energy and no heat is used in doing work.

 $Q_{\nu} = nC_{\nu}\Delta T$

And

 $\Delta U = nC_V \Delta T$

AIDCA FPREP BOOK

ELECTOSTATICS

ELECTRIC CHARGE:

Charge is property associated with matter due to which it produces and experiences electric and magnetic effects.

ELECTROSTATICS

- > There are two types of charge (i) Positive charge (ii) Negative charge
- ➤ Like charges repel each other and unlike charges attract each other.

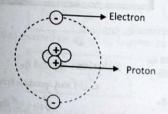

Example: Which of the following is greatest value of charge?

- (a) 10 C
- (b) 20 C
- (c) -5 C
- The smallest value of charge which can exist independently is $e = 1.6 \times 10^{-19}$

		1.6 × 10 1.6		
Particle	Electron or - ve β	Proton or +ve β	Neutron or γ-rays	α-particle
Charge	$-e = -1.6 \times 10^{-19} C$	$+e = 1.6 \times 10^{-19}C$	Zero	$+2e = 3.2 \times 10^{-19}C$
19 4	unit of characteristics			120 - 3.2 × 10 - C

- SI unit of charge is coulomb (in terms of base units A.s)
- > Every atom is electrically neutral (No. of electrons = No. of Protons)

Example: He-Atom

Net charge = +2e - 2e = 0

- Charge is quantized (charge is always an integral multiple of 'e')
- Law of conservation of charge

Q = ne

- Charge neither be created and nor be destroyed but can be transferred from one body to another and total charge always remains constant.
- Charge given to a conductor always resides on the outer surface.

AT PRI-P BOOL

Methods of charging:

1. By Friction: By rubbing two bodies together both bodies are equally and oppositely charged due to transfer of electrons from one body to another. Examples: (i) When glass rod is rubbed with the silk, the glass rod becomes positively

charged and silk is negatively charged. (ii) Clouds also get charged by friction.

2. By Electrostatic Induction: If a charged body is brought near a neutral body one side of neutral body (closer to charged body) is oppositely charged and while the other side is similarly charged.

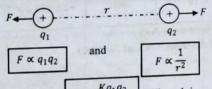

3. By Conduction: When a charged conductor in contact with an uncharged conductor, some charge is transferred to uncharged conductor thus both conductors are similarly charged.

COULOMB'S LAW

Force between two point charges is directly proportional to product of magnitude of charges and inversely proportional to square of the distance between them

Note Coulomb's Law is applicable only for point charge.

Where k is proportionality constant Kq_1q_2 \Rightarrow

Example: If charges are placed at corners of a square as shown in figure below then force is maximum between

(a) q_1 and q_2

Solution: q3 and q4 جن product &charges زياده و كالن ك در میان force بھی زیادہ ہوگی

(c) q3 and q4 (d) q_1 and q_4

or

UNIT 06 Properties:

Electric field lines are imaginary lines to visualize the electric field.

No. of electric field lines ∝ magnitude charge.

Electric field lines originate from positive charges and ends on negative charges.

ELECTROSTATICS

Lines are closer where field is strong and lines are path farther apart where field is weak. iv.

Tangent to field lines at any point gives the direction of electric field at that point.

No two field lines can cross each other because electric field has only one direction at a given point.

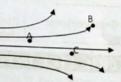

If the distance between the lines remains same then field is uniform and if the distance between the line does not remain same then the field is non unif-

Uniform field	Non uniform field	
-		

Example: A non-uniform electric field is shown in the figure then at which of the following point electric field is maximum

(a)A 🗸 (b)B

(d) same at all points

Electric field:

The space around the charge in which its electric force acts on other charge is called

ELECTRIC FIELD STRENGTH/INTENSITY

Electric field intensity at any point is defined as electric force per unit charge placed at that

Electric field intensity is a vector quantity.

> SI unit = $NC^{-1} = Vm^{-1}$, unit in terms of base units = $kgms^{-3}A^{-1}$,

 \triangleright Dimensions = $[MLT^{-3}A^{-1}]$

Electric force: Force acting on a charge 'q' in an electric field \vec{E} is

Electric force on a charge only depends upon magnitude of charge and electric field.

Electric force is independent of mass, velocity or direction of motion of charged particle. Electric force on positive charge is always parallel to electric field. Electric force on negative charge is always anti-parallel to electric field.

AIDCAT PREP BOOT

By AZHAR IOBAL 0336-7098894

Effect of medium:

> Presence of dielectric medium (insulator) always reduces the electric force between the charges by a factor ϵ_r .

(اگر کوئی دو Quantities معلوم ہول تواس relation ہے تیسری کو معلوم کریں)

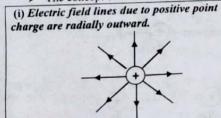

→ Relative permittivity → Dielectric constant → Dielectric coefficient

- $\epsilon_{\rm r}$ is constant for given material and different for different materials.
- Value of ϵ_r is always greater than or equal to one for vaccume: $\epsilon_r = 1$, for insulating materials $\epsilon_r > 1$, For metals: $\epsilon_o = \infty$
- \triangleright ϵ_r has no units, no dimensions.

· Material	Er	Material	\in_{r}
	1.0006	Ammonia Liquid	22-25

Flectric Potential: (Absolute Potential)

Electric potential at any point is defined as work done in bringing a unit positive charge from infinity to that point while keeping the charge in equilibrium.

$$V = \frac{W}{q_0}$$

UNIT 06

- > Potential is scalar quantity. > SI unit = volt = $\int C^{-1} = kgm^2s^{-3}A^{-1}$, Dimensions = $[ML^2T^{-3}A^{-1}]$

Potential difference:

Potential difference between two points is defined as work done in bringing a unit positive charge from one point to another while keeping the charge in equilibrium.

$$V_A - V_B = \frac{W}{q_o}$$

$$\Delta V = \frac{W}{q_o}$$

Work done on the charge:

When a particle of charge q and mass m nasses through P.d V then work done on it is given as

$$W = qV$$

- \triangleright $W \propto q$ and $W \propto V$
- W is independent of mass of particle

Gain in speed:

The gain in speed of particle when it is accelerated by P.d V is given as

$$v = \sqrt{\frac{2qV}{m}} > v \propto \sqrt{q}$$

$$> v \propto \sqrt{V}$$

$$> v \propto \frac{1}{\sqrt{q}}$$

Change in kinetic energy:

When a particle of charge q and mass mpasses through P.d, V then change in K.E is

- $\Delta K. E \propto q$ and $\Delta K. E \propto V$
- ΔK. E is independent of mass of

Change in potential energy:

When a particle of charge q and mass m passes through P.d, V then change in P.E is given as

$$\Delta P.E = qV$$

- $\Delta P.E \propto q$ and $\Delta P.E \propto V$
- $\Delta P. E$ is independent of mass of

Gain in momentum

The gain in momentum of a particle when it is accelerated through P.d V is given as

$$p = \sqrt{2mqV} \Rightarrow p \propto \sqrt{m}$$
$$\Rightarrow p \propto \sqrt{q}$$
$$\Rightarrow p \propto \sqrt{V}$$

Example:

If an electron and a proton are accelerated through same P.d then which of the following statement is true

- (a) both will gain equal K.E
- (b) electron will gain greater speed
- (c) proton will gain greater momentum
- (d) all of these ✓

AT PREP BOOF

Example:

If an electron and a proton are accelerated through same P.d then which one will gain greater momentum

(a) Electron

(b) Proton

(c) Both gain same (d) None

Solution: As $m_p > m_e$ and $P \propto \sqrt{m}$ So proton will gain

greater momentum.

Potential Gradient

- \rightarrow The quantity $\left(\frac{\Delta V}{\Delta r}\right)$ which gives the maximum rate of change of potential Δr with distance is called potential gradient.
- > Its SI unit is $Vm^{-1} = NC^{-1} = kgms^{-3}A^{-1}$
- > Electric field intensity and potential gradient have same units.
- > Potential gradient is a vector quantity.
- If electric field in a given region is zero then electric potential in this region is constant
- If electric field is constant it means that electric potential is changing at constant rate in this region

If V is P.d between two points

Relation with electric field

> Electric field is equal to -ve potential gradient.

$$\vec{E} = -\frac{\Delta V}{\Delta r}$$

- \triangleright If $E = 0 \Rightarrow \Delta V = 0$ and V = constant
- $If V = constant then \Delta V = 0 \Rightarrow E = 0$
- > In direction of electric field potential decreases.
- In opposite direction of electric field potential
- > In perpendicular direction of electric field potential remains same.

Example: P.d. between two oppositely charged parallel plates is 12V as shown in the figure then electric field between the plates will be

(a) $1.2NC^{-1}$ (b) $12NC^{-1}$

(c) $120NC^{-1}$

(d) Zero

Example: P.d. between two oppositely charged parallel plates is 12V as shown in the figure then electric field between the plates will be

- (a) Potential is maximum at B (b) Potential is minimum at A
- (c) Potential is same at C & D (d) All of these

Solution:

$$E = \frac{V}{d}$$

$$= \frac{12}{10 \times 10^{-2}}$$

 $= 120NC^{-1}$

Solution:

Correct option is d In direction of electric field potential decreases but in perpendicular direction potential remains constant.

ELECTRIC POTENTIAL DUE TO POINT CHARGE

Electric potential at any distance r due to a point charge q is given as

UNIT 06

Note

Potential due to +ve charge is +ve Potential due to -ve charge is -ve

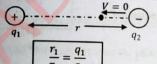

> In presence of dielectric medium potential decreases by ϵ_r times

$$V_{med} = \frac{V_{vac}}{\epsilon_r}$$

$$V_{med} = \frac{1}{4\pi\epsilon_o \epsilon_r} \frac{q}{r}$$

Zero Potential Location

a) When charges are opposite (let $q_2 < q_1$)

ہور سی اگر چار بر Zero Potential ہوار ترک ایٹ چار برے در میان ہو گا اور smaller چار ج کے قریب ہو گا۔

Distance of zero potential point from first charge

$$r_1 = \frac{q_1 r}{q_1 + q_2}$$

Distance of zero potential point from second

Example: Potential at a point midway between two equal and opposite charges is Solution:

$$q$$
 $V = 0$ $-q$

$$\frac{kq}{r}$$
 (b) $\frac{2kq}{r}$

$$= 0 \qquad -6$$

$$= \frac{kq}{r} - \frac{kq}{r}$$
$$= 0$$

 $V = V_+ + V_-$

Example: If $-1\mu C$ and $2\mu C$ charges are separated by distance 6m then find the position of point where potential is zero

(a) 2m from $-1\mu C$ (c)1m from $-1\mu C$

(b)2m from 2µC

(d)1m from 2µC

Solution:

$$x = \frac{q_1 r}{q_1 + q_2}$$
$$x = \frac{1 \times 6}{1 + 2} = 2m$$

zero potential point lies 2m from -1µC charge and 4m from 2µC charge

AT PRIP BOOK

b) When charges are similar (both are +ve or both are -ve) then zero potential point lies are infinity.

Electro Cardio Graphy:(ECG)

An ECG records the voltages between points on human skin generated by heart and it provide information about the performance of heart.

Electroencephelography:(EEG)

An EEG records the potential difference created by brain and provide information about for abnormal behavior.

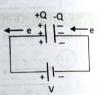

Electroretinoraphy:(ERG)

An ERG records the potential difference generated by retina

CAPACITOR

Capacitor is a device which can store electric charge.

- When battery is connected across the plates of parallel plate capacitor, battery removes electrons from one plate and transfers electrons to other plate.
- > Capacitor continue charging until its P.d becomes equal to P.d of the battery.
- Net charge on a capacitor is always zero.

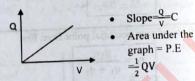

graph = P.E

 $=\frac{1}{2}QV$

Charge on the capacitor is directly proportional to P.d across the plates of capacitor.

$$Q \propto V$$
 OR $Q = 0$

Where C is proportionality constant known as capacitance.

Electric field intensity between plates of capacitor is

$$E = \frac{\sigma}{\epsilon_o \epsilon_r} = \frac{Q}{A \epsilon_o \epsilon_r}$$

Relation between electric field and P.d across the capacitor is

$$E = \frac{V}{d}$$

Electric force between the plates of capacitor is given as

$$F = QE$$

$$F = Q\left(\frac{Q}{2A\epsilon_0\epsilon_r}\right)$$

$$F = \frac{Q^2}{2A\epsilon_0\epsilon_r}$$

By AZHAR IQBAL 0336-7098894

CAPACITANCE

ELECTROSTATICS

Capacitance of parallel plate capacitor is defined as amount of charge on one plate necessary to raise its potential by one volt w.r.t. other plate.

$$C = \frac{Q}{V}$$

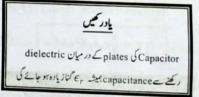

- > SI unit of capacitance is farad.
- $F = CV^{-1} = kg^{-1}m^{-2}s^4A^{-2}$ (Dimensions = $[M^{-1}L^{-2}T^4A^{-2}]$)
- > Capacitance of parallel plate capacitor is given as

$$C_{med} = \frac{A\epsilon_o\epsilon_r}{d} \quad OR$$

$$C_{vac} = \frac{A\epsilon_o}{d}$$

It only depends upon three factors. (i). Area of the plates C ∝ A.

- Distance between the plates $C \propto \frac{1}{4}$
- (iii) Medium between the plates $C \propto \epsilon_r$

Note

C is proportionality constant and it is

independent of Q and V

Examples:

If length, width and thickness of plates of a capacitor are doubled then its capacitance will become

- (a) Double (c) Eight Times
- (b) Four Times
- (d) Remains same

Solution Since C is independent of thickness and $C \propto A \Rightarrow C \propto length \times width$ Hence capacitance becomes four times.

Dielectric Constance:

The ratio of capacitance of parallel plate capacitor when dielectric is as medium between the plates to capacitance of parallel plate capacitor when vacuum is medium between the plates.

$$\epsilon_r = \frac{C_{med}}{C_{vac}}$$

- Since $C_{med} > C_{vac} \implies \epsilon_r > 1$
- · It only depends on nature of the medium
- Its value is always greater or equal to one
- · It has no unit no dimensions

ADCAT PREP BOOF

Energy Stored in Capacitor:

- > Capacitor is a device which can store the charge, alternatively capacitor is a device which can store electrical energy.
- > Charge stored on plates of capacitor posses electrical P.E arises due to work done by battery to deposite charge on the plates.
- > P.E stored on the plates of capacitor is given as

i.
$$P.E = \frac{1}{2}QV$$

ii.
$$P.E = \frac{1}{2}CV^2$$

iii.
$$P. E = \frac{Q^2}{2C}$$

- کونا relation کب question کرناہے ا ری ک depend information کرے
- > Energy stored in the capacitor can be regarded that energy is stored in form of electric field between the plates instead of P.E of the charges on the plates.

$$P.E = \frac{1}{2}\epsilon_o\epsilon_r E^2(Ad)$$

And

Energy density =
$$\frac{1}{2}\epsilon_o\epsilon_r E^2$$

Three Important cases for capacitor

If battery remains connected across capacitor or capacitors are connected in parallel then V = constant

$$Q = CV$$

$$\frac{Q_1}{Q_2} = \frac{C_1}{C_2}$$

$$P.E = \frac{1}{2}CV^2$$

$$\Rightarrow P.E \propto C$$

$$\frac{P.E_1}{P.E_2} = \frac{C_1}{C_2}$$

Example:

A capacitor is connected across a 12V battery. If a dielectric medium is introduced between the plates then which of the following statement is true.

- (a) Capacitance increases (b)Charge increases
- (c) Energy increases
- (d) All of these

Solution:

As V = constant so $Q \propto C$ and $P.E \propto C$ By introducing dielectric C increases so Q and P.E also increases.

Example:

If $4\mu F$ and $6\mu F$ capacitor are connected in parallel that the ratio between charge stored in capacitor and energy stored in capacitor will be

- (a) 2:3 and 2:3 (c) 3:2 and 3:2
- (b) 2:3 and 3:2 (d) 3: 2 and 2:3

Solution

:Since V = constant.

MDCAT PREP BOOK

126

By AZHAR IQBAL 0336-7098894

If battery is not connected to capacitor (isolated capacitor) or capacitor are connected in series then Q = constant

$$Q = CV \qquad \Rightarrow \qquad V \propto \frac{1}{C}$$

$$\frac{V_1}{V_2} = \frac{C_2}{C_1}$$

$$P.E = \frac{Q^2}{2C}$$

$$\Rightarrow P.E \propto \frac{1}{c} \quad and \quad \frac{P}{P}$$

Example: If distance between the plates of a charged Solution capacitor is doubled then energy stored in capacitor will As Q = constantbecome

- (a) Double
- (b) Half
- (c) Four Times
- (d) Remains same

so P. E $\propto \frac{1}{C}$ and $C \propto \frac{1}{C}$

by doubling distance C becomes half thus energy

becomes double

Example: If $C_1 = 2\mu F$ and $C_2 = 4\mu F$ are connected in | Solution: As Q = constantseries then ratio between their voltages will be

(a) 1:1 (c) 2:1

- (b) 1:2
- (d) 1:4

so $V \propto \frac{1}{c}$

$$As \frac{c_1}{c_2} = \frac{1}{2} \implies \frac{v_1}{v_2} = \frac{2}{1}$$

3. If area of plates distance between the plates and medium between the plates are not changed then C = constant

As
$$Q = CV$$
 \Rightarrow $Q \propto V$ or $\frac{Q_1}{Q_2} = \frac{V_1}{V_2}$ and $P.E = \frac{1}{2}CV^2$ \Rightarrow $P.E \propto V^2$

Example: If voltage across capacitor is doubled then Solution: As C = constantenergy stored in capacitor will becomes

(a) Double

(c) Four Times

- (b) Half
- (d) Remains same

 $P.E = \frac{1}{2}CV^2 \Rightarrow P.E \propto V^2$ If V is doubled then energy will become four times

SERIES COMBINATION OF CAPACITORS

If capacitors end to end such that same charge is stored across all of them then this combination is known as series combination.

(Lunczy capacitors funconnected は path いし(capacitors が)

Example 1

4. Cea < Cmin

ری کے آئے گا کے capacitance کے میں کم آئے گا C_{eq}

5. To decrease the capacitance capacitors are connected in series.

Example:

If two capacitors $C_1 = 4\mu F$ and $C_2 = 6\mu F$ are connected in series with a 12V battery as shown

i. $C_{eq} = \frac{C_1 C_2}{C_1 + C_2} = \frac{4 \times 6}{4 + 6} = \frac{24}{10} = 2.4 \mu F$

ii. $Q_1 = Q_2 = Q = C_{eq}V = 2.4 \times 12\mu C =$

28.8 μ C and $\frac{Q_1}{Q_2} = 1$ iii. $V_1 = \frac{C_2}{C_1 + C_2}V = \frac{6}{4+6} \times 12 = 7.2V$

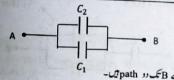

iv. $V_2 = \frac{c_2}{c_1 + c_2} V = \frac{4}{4 + 6} \times 12 =$

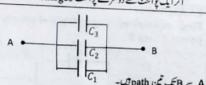

4.8V and $\frac{V_1}{V_2} = \frac{C_2}{C_1} = \frac{3}{2}$ v. $V_1 + V_2 = 7.2 + 4.8 = 12V = V$

COMBINATION OF CAPACITORS

If capacitors are connected are connected side by side such that same potential difference is applied across all of them then this combination is known as parallel combination.

اگرایک پوائٹ سے دوسرے پوائٹ charges گزرنے کے لیے ایک سے زیادہ path ہوں تو capacitors آپس میں parallel میں ہوں کے

➤ When capacitors are connected in parallel then voltage across each capacitor is same

$$V_1 = V_2 = V$$
 And $\frac{V_1}{V_2} = 1$

When capacitors are connected in parallel total charge is divided among the capacitors $Q = Q_1 + Q_2$

As V is same so

EXAMPLE6:

Find equivalent capacitance between the points A and B

SOLUTION

Zavan Publishe

There are three path from A to B hence three capacitors are in parallel

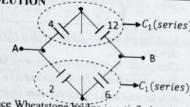

$$C_{eq} = \frac{C}{3} (capacitors have same value)$$

EXAMPLE6:

Find equivalent capacitance between the points A and B

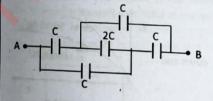

SOLUTION

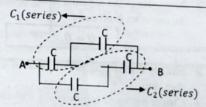

Since Wheatstone bridge is satisfied so 20F

capacitance can be deleted
$$C_1 = \frac{4 \times 12}{4 + 12} = 3 \text{ and } C_2 = \frac{2 \times 6}{2 + 6} = 1.5$$

$$C_{eq} = 3 + 1.5 = 4.5$$

Since Wheatstone bridge is satisfied so 2C capacitance can be deleted

$$C_1 = \frac{c}{2}$$
 (capacitors have same value)
 $C_2 = \frac{c}{2}$ (capacitors have same value)

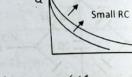

$$C_{eq} = \frac{C}{2} + \frac{C}{2} = C$$

CHARGING AND DISCHARGING OF CAPACITORS

Charging of capacitor:

- > To charge the capacitor, capacitor is connected with a voltage source(battery) as shown in the figure below
- > Charging of a capacitor continues until the potential difference of capacitor becomes equal to the potential difference of source.
- > At any instant the charge on the plates of capacitor is
 - $Q = Q_o \left(1 e^{-t/RC} \right)$
- > With the passage of time charging of capacitor
- > Charge increases exponentially with time
- Time constant: Time required by a capacitor to deposit 0.63 or 63% equilibrium charge.

t = RC

اگر کوئی دو Quantities دی گئی ہوں تواس relation تیری معلوم کریں

Unit: It's unit is second

Large RC

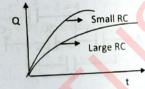

Discharging of Capacitor:

> To discharge the capacitor at any instant 't' charge on the capacitor is given as

$$Q = Q_o e^{-t/RC}$$

> Initially discharging is fast, later on it slow down and then stop

Large RC

Time required to discharge 0.63 or 0.63% of equilibrium charge is called time constant.

$$t = RC$$

اگر کوئی دو Quantities وی می مول تواس relation تیری معلوم کریں

- Unit of RC is second ohm × forced = sec
- \triangleright After time equal to time constant (t = RC), 63% capacitor is discharged and remaining charge on the capacitor is 37%

The charging and discharging of a capacitor enables some windshield wipers of cars to be used intermittently during a light drizzle in this mode of operation the wipers remain off for a while and turn on briefly. The timing of on-off cycle is determined by time constant of visitor-capacitor combination.

CURRENT ELECTRICITY

Zavan Publisher

UNIT 07

INIT 07 >> CURRENT ELECTRICITY

ELECTRIC CURRENT:

- > Rate of flow of charge is called electric current or charge passing through cross section area of the conductor per unit time is called current.
- > Average current is given as

Voltage بر coulomb چارج کی از جی کو ظاہر کر تا ہے۔ Current بر سيند من گذرنے والے جار جزكي تعد او كو ظاہر كرتا ہے-

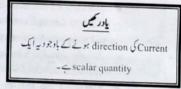

> Slope of Q-t graph represent the current

- > Current is a scalar quantity.
- Current is a base quantity and its SI unit is ampere $(A = Cs^{-1})$
- > Current is one ampere if one coulomb charge is passing through conductor in one second
- > If 'n' is number of electrons (or protons) passing through a point in time t then Q = ne and average current is

Note

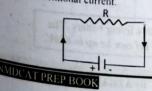

One ampere current means 6.25×10^{18} electrons are passing through a conductor in one second

Charge Carriers:

•	Semi-conductors
Ions and free e	Free electrons and holes
	lons and free e

Conventional Current:

Equivalent current due to flow of positive charge carriers from high potential to low potential is called conventional current.

Electronic current:

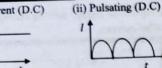

Current due to flow of electrons (negative charge carriers) from low potential to high potential is called electronic current

135

Other Types of Current:

(iii) Alternating Current (A.C)

Current though metallic conductor:

- In metallic conductors charge carriers are free electrons.
- > Free electrons are in state of random motion like gas molecules, electrons collide with each other and with lattice atoms and thus they change their direction.
- ➤ Thermal velocity of electrons is several 100 km/s
- > When no potential difference is applied across conductor
 - Average velocity of electrons is zero.
 - · Net flow of electrons is zero.
 - Current through conductor is zero.

- · Electrons are still in state of random motion but flow of electrons towards high potential (+ve) is greater than flow of electrons towards low potential (-ve) and thus net flow is not zero.
- Electrons are drifted towards high potential and an electric current passes through conductor.

Drift velocity:

Average velocity gained by electrons when a potential difference is applied across the conductor is called drift velocity.

- ➤ Drift velocity is of the order of 10⁻³m/s or 1mms⁻¹
- ➤ Drift velocity of electrons is always opposite to direction of electric field.

(n is number of charge carriers per unit volume)

Information: When eel senses danger ,it turns itself into a living battery .The potential difference between head and tail of an electric eel can be up to 600V.

By AZHAR IQBAL 0336-7098894

CURRENT ELECTRICITY

Zavan Publisher

UNIT 07 Source of current:

A device which maintains a constant Potential difference across the two ends of a conductor is called source of current. Source of current converts some nonelectrical energy into electrical energy.

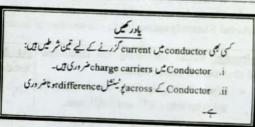

Ideal current source:

A current source which maintains a constant current irrespective of load resistance is called ideal current source. Its internal resistance is infinite

Source of current	Cell / Battery	Generator	Thermocouple	Solar cell
Converts	Chemical	Mechanical	Heat energy	Light energy
	energy into	energy into	into electrical	into electrical
	electrical energy	electrical energy	energy	energy

Ideal voltage source:

A voltage source whose output voltage is independent of current drawn from it is called ideal voltage source. Its internal resistance is zero.

EFFECTS OF CURRENT

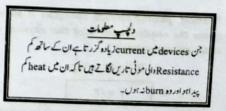

Heating effect:

- > Current passing through a conductor produces heat in the conductor.
- ➤ When current passes through conductor electrons collide with atoms and transfer some energy to atoms thus average K.E of atoms increases and temperature of conductor increases.
- > Applications: Electric heater, electric stove, electric kettle, electric iron, filament

Joule's law of heating:

When current I is passing through conductor of resistance R for time t then heat produced in conductor is given as

 $H = I^2 Rt$

AMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

0+0

Magnetic effect:

- > Current produces through the conductor produces magnetic field around the
- > Strength of magnetic field depends upon amount of current.
- > Pattern of magnetic field depends upon shape of conductor.
- > Applications: Voltmeter, ammeter, galvanometer, motors, electromagnets, speaker

Chemical effect:

Current passing through electrolyte produces chemical changes in it. Electrolytes: liquids which can conduct electricity are called electrolytes.

Anode: Electrode connected to +ve terminal of battery.

Cathode: Electrode connected to -ve terminal of battery

Voltmeter: vessel containing the electrolyte and electrodes is called voltmeter.

• When CuSO4 is dissolved in water it splits up into Cu^{+2} and SO_4^{-2} ions.

$$CuSO_4 \longrightarrow Cu^{+2} + SO_4^{-2}$$

At Cathode: Cu+2 ions move towards the cathode and get deposit there

$$Cu^{+2} + 2e^{-} \longrightarrow Cu$$

At Anode: SO₄⁻² ions move towards the anode and remove one cell atom of anode.

$$SO_4^{-2} + Cu \longrightarrow CuSO_4 + 2e^-$$

Electroplating: Process of coating a thin layer of some expensive metal on an article of cheap metal is called electroplating.

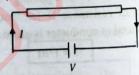

OHM'S LAW

"Current passing through conductor is directly proportional to potential difference applied across the conductor provided that physical conditions (Area, length, volume, temperature, strain etc) are constant"

$$I \propto V \quad or \quad I = \frac{V}{R}$$

$$\Rightarrow \qquad V = IR$$

Where R is constant and known as resistance of conductor.

By AZHAR IQBAL 0336-7098894

UNIT 07 Resistance:

Resistance is measure of opposition in the flow of electrons due to their continuous bumping with atoms of the lattice.

Resistance of a conductor is independent of applied voltage and current passing through the circuit.

- > SI unit of resistance is ohm $\left(ohm = \frac{volt}{ampere}\right)$
- > Resistance is one ohm if one ampere current passes through conductor in one second.

CURRENT ELECTRICITY

▶ In terms of base units the unit of resistance is $kam^2s^{-3}A^{-2}$ $(dimensions = [ML^2T^{-3}A^{-2}])$

Ohmic Devices:

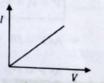

Devices which obey the Ohm's law are called ohmic devices.

· Conductance is reciprocal of resistance

$$Conductance = \frac{1}{resistance}$$

- Resistance and conductance of an ohmic device remains
- Resistors and metallic wires for constant temperature are ohmic.

Slope of I-V graph represents the conductance.

Non-Ohmic Devices:

- > Devices which do not obey Ohm's law are called non-ohmic devices.
- > I-V graph for non-ohmic devices is not a straight line (non-linear).
- Slope of I-V graph represent the conductance.
- Resistance and conductance of a non-ohmic device does not remains constant.
- Filament bulb, diodes, discharge tubes, transistors, capacitors, inductor etc. are non-ohmic

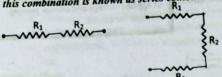

Semiconductor Diode:

. Series combination:

If resistors are connected end to end such that same current is passing through all of them this combination is known as series combination.

(Luncz resistors Junconnected of path Garesistors Si)

- > Current passing through each resistor is $I_1 = I_2 = I$
- (کی بھی resistor ہے گزرنے والا current معلوم کرنے کے لیے میلے

> Voltage is divided among the resistors

$$V = V_1 + V_2$$

* As V = IR > V \(\alpha\) (& \(\text{drop object across voltage } \(\subset \text{U \(\text{S roly iresistance } \(\text{U} \))

$$\star$$
 As $P = I^2 R \Rightarrow P \propto R$

(جس کی resistance کاریده موگی اس ش Power می زیاده فری موگی)

Voltage Divider Rule

If two resistance R₁ and R₂ are in series with voltage V then

$$V_1 = \frac{R_1}{R_1 + R_2} V$$
 and
$$V_2 = \frac{R_2}{R_1 + R_2} V$$

Example: Two resistances $R_1 = 2\Omega$ and $R_2 = 4\Omega$ are connected in Solution: $V_2 = \frac{R_2}{R_1 + R_2}V$ series with a 12V battery then voltage drop across 4Ω resistor will be $=\frac{4}{4+2} \times 12 = 8V$ (b) 4V (a) 2V

Equivalent Resistance:

If 'n' number of resistors are connected in series then

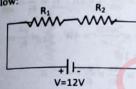

- (اگرب سے پہلے دیکھیں کہ resistance برابر ہیں تو resistance کو تعدادے multiply کردی)
- $R_{eq} = R_1 + R_2 + \dots + R_n$ (sumb resistances resistance) syralues
- 3. $R_{eq} > R_{max}$
- 4. To increase the resistance, resistors are connected in series.

UNIT 07

CURRENT ELECTRICITY

Example:

If two resistors $R_1 = 2\Omega$ and $R_2 = 4\Omega$ are connected in series are as shown in the figure helow:

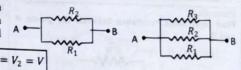

- 1. $Req = R_1 + R_2 = 2 + 4 = 6\Omega$
- 2. $I = I_1 = I_2 = \frac{V}{Reg} = \frac{12}{6} = 2A$
- 3. $V_1 = \frac{R_1}{R_1 + R_2} V = \frac{2}{2+4} (12) = \frac{2}{6} (12) = 4V$
- 4. $V_2 = \frac{R_2}{R_1 + R_2} V = \frac{4}{2+4} (12) = \frac{4}{6} (12) = 8V$

- 7. $P_1 = I^2 R_1 = (2)^2 (2) = 4 \times 2 = 8W$

$P_2 = I^2 R_2 = (2)^2 (4) = 4 \times 4 = 16W$

Parallel Combination:

If resistors are connected side by side such that same P.d is applied across all of them then this combination is known as parallel combination.

- ➤ Voltage across each resistor is same. $V_1 = V_2 = V$ \triangleright Current is divided $I = I_1 + I_2$
 - * As $I = \frac{V}{R}$ $\Rightarrow I \propto \frac{1}{R}$ (% $\Rightarrow I \propto \frac{1}{R}$ (% $\Rightarrow I \propto \frac{1}{R}$ (% $\Rightarrow I \sim \frac{1}{R}$ $\Rightarrow P \propto \frac{1}{R}$ (% $\Rightarrow P \sim \frac{1}{R}$)

* As
$$P = \frac{V^2}{R}$$
 $\Rightarrow P \propto \frac{1}{R}$ (Green Fower of Unity resistance (Green)

Current Divider Rule:

If two resistors R_1 and R_2 are connected in parallel with total current I then current through each resistor is given as

$$I_1 = \frac{R_2}{R_1 + R_2} I$$
 and $I_2 = \frac{R_1}{R_1 + R_2}$

Equivalent Resistance:

If 'n' number of resistors are connected in series then

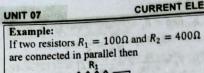

- 1. $R_{eq} = \frac{R}{n}$ (1) $R_{eq} = \frac{R_1 R_2}{R_1 + R_2} = \frac{product\ of\ resistances}{sum\ of\ resistanc\ e}$ (2) $R_{eq} = \frac{R_1 R_2}{R_1 + R_2} = \frac{product\ of\ resistances}{sum\ of\ resistanc\ e}$ (2) $R_{eq} = \frac{R_1 R_2}{R_1 + R_2} = \frac{product\ of\ resistances}{sum\ of\ resistanc\ e}$

- 3. $\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2} + \dots + \frac{1}{R_n} \left(\sqrt{2} \int use^{\int use^$
- 4. To decrease the resistance, resistors are connected in parallel.
- $R_{series} = n^2 R_{parallel}$

 R_{series} = Equivalent resistance when resistors are connected

 $R_{parallel}$ = Equivalent resistance when resistors are connected in parallel.

MDCAT PREP BOOK

and B

Resistance

It is found that resistance of a conductor is Resistance is property of a wire and it directly proportional to length of conductor and inversely proportional to cross-sectional area of the conductor

depends upon.

i. Length of conductor

Area of conductor

Temperature of conductor

Nature of material

Relation with length of wire	Relation with area of wire	Relation with radius of wire	Relation with diameter of wire
RαL	$R \propto \frac{L}{A}$	$R \propto \frac{1}{r^2}$	$R \propto \frac{1}{d^2}$

145

ADCAT PREP BOOK

Example:

If a wire is stretched to twice of its

length then its resistance will become

(a) Double

(b) Half

(c) Four Times

(d)One Fourth

Solution:

If length is doubled, area will become half $R \propto \frac{L}{A}$ so resistance will become 4-times

Example: If a wire of resistance R is cut into three equal parts and these parts are connected in parallel then its equivalent resistance will become

(a) R

 $(b)^{\frac{R}{2}}$

 $(c)\frac{R}{c}$

(d) 3R

Example: If a wire of resistance 12 ohm is bent along the Solution: sides of an equilateral triangle then the resistance between $R_1 = 4 + 4 = 8$ its any two vertices will be

(a) 6 ohm

(b) 4 ohm

 $(c)\frac{8}{3}$ ohm

(d) 4 ohm

NOTE: As triangle has three sides so resistance of each side =

Example: If a wire of resistance 120hm is bent along the | Solution: sides of a square then the resistance along diagonal will be $(b)_{3}^{4}$ ohm $(c)_{3}^{6}$ ohm $(d)_{4}^{4}$ ohm

(a) 6 ohm

$$R_1 = 4 + 4 = 8$$

$$R_{eq} = \frac{4 \times 8}{4 + 8} = \frac{8}{3}$$

ادر عی جب stretch & wire کرویں کے

زعة كنا length الماده الالمادة

- time

Solution: If wire is cut into three

equal parts then resistance of

each part is $\frac{R}{2}$ by connecting in

parallel $R_{eq} = \frac{R/3}{3} = \frac{R}{9}$

 $R_{eq} = \frac{4 \times 8}{4 + 8} = \frac{8}{3}$

NOTE: As square four sides so resistance of each side = $\frac{12}{4}$ = 3

Example: If a wire of resistance 20 ohm is bent along the circle then the resistance along diameter will be

(a) 6 ohm

(d) 4 ohm $(b)^{\frac{4}{3}}$ ohm $(c)^{\frac{8}{3}}$ ohm

Resistivity or Specific Resistance:

- Resistance of a meter cube of a Dependence: material is called resistivity or specific resistance.
- SI unit of resistivity is ohm-m $(kgm^3s^{-3}A^{-2})$ and dimensions are $[ML^3T^{-3}A^{-2}]$
- Resistivity is property of material and it is independent of length, area or dimensions of conductor.
- Resistivity only depends upon temperature and nature of material.

Resistivity کے اور کی جی فار سولے میں المحقود کی المحق proportionality کانشٹ اس فار مولے کی باقی quantities نیس کر تا۔

Conductivity

UNIT 07

> Reciprocal of resistivity is called Dependence: conductivity.

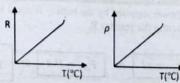

> Its SI unit $ohm^{-1}m^{-1}(kg^{-1}m^{-3}s^3A^2)$

- Conductivity is property of material and it is independent of length, area or dimensions of conductor.
- Conductivity only depends upon temperature and nature of material.

Temperature dependence:

By increasing temperature, average K.E of atoms increases due to which the amplitude of vibrations of atoms increases thus probability of collisions of electrons with atoms increasaes. Since resistance is due to collision of electrons with atoms hence resistivity or resistance of conductor increases by increasing temprature.

> Resistance or resistivity of metals increase linearly with temperature.

AMDCAT PREP BOOK

147

Temperature Coefficient of Resistance

Fractional change in resistance per Kelvin is called temperature coefficient of resistance.

$$\alpha = \frac{R_t - R_o}{R_o t}$$

- ightharpoonup Its SI unit is K^{-1} .
- It only depends upon nature of material.
- For all metals (Cu, Al, Fe etc.) α is positive which means by increasing temperature their resistance increases (conductance decreases).
- For semi-conductors insulators and electrolytes (C, Si, Ge) α is negative which means by increasing temperature their resistance decreases (and conductance increases)

Temperature Coefficient of Resistivity:

Fractional change in resistivity per Kelvin is called temperature coefficient of resistivity.

$$\alpha = \frac{\rho_t - \rho_o}{\rho_o t}$$

> Its SI unit is K^{-1} .

Electrical Power

Electrical power:

"Energy supplied by cell or battery per unit time is called electrical power of the battery or cell."

$$P = \frac{Energy \ suppli \ ed}{Time}$$

or

$$P = VI$$

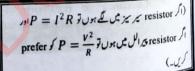

Cell

Charge Δq move from high potential to low potential and dissipates its energy across resistance R and comes to low potential. Battery supplies the energy to charge and move it from low potential to high potential.

Power dissipated across resistor:

Power supplied by the battery is equal to power dissipated across the resistor R

ELECTROMOTIVE FORCE

Energy supplied by battery per unit charge is called electromotive force or EMF of battery.

$$EMF = \frac{Energy \ supplied}{Charge}$$

- > It is a scalar quantity.
- $Its SI unit is volt(<math>\int c^{-1} = kgm^2s^{-3}A^{-1}$)
- ightharpoonup Its dimensions are $[ML^2T^{-3}A^{-1}]$

Internal Resistance:

Resistance due to presence of electrolyte between the electrodes is called internal resistance. It is denoted by 'r'.

- > EMF and internal resistance act in series.
- > Internal resistance of an ideal voltage source is zero.

Dependence:

Distance between electrodes $(r \propto d)$.

Area between electrodes $\left(r \propto \frac{1}{4}\right)$.

Nature or concentration of electrolyte.

Temperature

By AZHAR IQBAL 0336-7098894

UNIT 07

Three Important Cases:

1. Closed Circuit:

Consider an external resistance R is connected across a battery of EMF 'E' and internal resistance 'r'

- > Current drawn from the battery is
- > Potential drop across external resistance or terminal Potential $V_t = IR$ difference is
- Potential drop across internal resistance is 'I r'.
- ▶ Equation of cell/battery when it is discharging is $E = V_t + Ir$ and $(V_t < E)$

CURRENT ELECTRICITY

- > Power dissipated in external resistance is $P = V_t I = I^2 R = \frac{V_t^2}{R} = \frac{E^2 R}{(r+R)^2}$
- > Output power drawn from battery is maximum when R=r (internal resistance = external resistance)

> Current drawn from battery is maximum when R= r

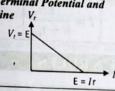

r=R

Zayan Publisher

NOTE: when battery is being charged i.e current is given to battery then $V_* = E + Ir$ and $V_* > E$

For x-intercept V= 0 So E = Ir or $r = \frac{E}{r}$ For y-intercept I= 0

مراف سے EMF اور Internal resistance دونوں معلوم کے جاسکتے ہیں۔

2. Open Circuit:

When no current is being drawn from battery or cell it is said to be open circuit.

- > Current through circuit= 0
- \triangleright Terminal potential difference is equal to $(V_t = E)$.
- > Potential drop across internal resistance and external resistance is zero. R

3. Closed Circuit:

When two terminals of cell or battery are joined together by thick wire.

Maximum current is drawn from battery

Terminal potential difference is zero (V = 0).

GROUPING OF CELLS

1. Series Grouping:

1. Series Grouping: If opposite terminals are connected with each other.	Equivalent EMF is given as $E_{eq} = E_1 + E_2 + E_3$ Equivalent internal resistance is given as $r_{eq} = r_1 + r_2 + r_3$
E_1 E_2 E_3	

			1 11
If similar termina	Is are conf	nected with ear	ch other.
Il Sillillai terillilla	as the com	To .	
	. 11	ALLA	
	m-1-	MM-	
E.	E ₂	Mark Street

Equivalent EMF is given as $E_{ea}=E_1-E_2$

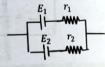

Equivalent internal resistance is given as $r_{eq} = r_1 + r_2$

> If cells are identical

Fauivalent EMF is	Equivalent internal resistance	Current	Power
$E_{eq} = nE$	$r_{eq} = nr$	$I = \frac{E_{eq}}{R + r_{eq}}$	$P_{max} = n(\frac{E^2}{4r})$

2. Parallel Grouping:

If similar cathodes terminals are connected together at one point and anodes are connected together at other point.

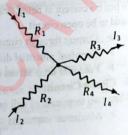

Equivalent EN	IF Equivalent internal resistance	Total Current	Current through each cell
is $E_{eq} = E$	$r_{eq} = \frac{r}{n}$	$I = \frac{E}{R + r_{eq}}$	$I_n = \frac{1}{n}$

KIRCHOFF'S RULES

1. Kirchoff's First Rule:

- > Kirchoff's first rule is also known as Kirchoff's current rule, point rate or junction rule.
- > Kirchoff's 1st rule is manifestation of law of conservation of charge.

"Sum of all the currents flowing towards a point is equal to sum of all the currents flowing away from point." "sum of all the currents meeting at a point is equal to zero"

 $\Sigma I = 0$

By AZHAR IQBAL 0336-7098894

Then the current I will be

(b) 3A (c) 5A (d) 7A (a) 1A

Solution:

CURRENT ELECTRICITY

Example: Figure shows a network of current. Total incoming current = 2 + 4 + 1 = 7A

Total out going current = 7A OR

"Sum of all the currents meeting at point is equal to zero" $\Sigma I = 0$

 $2A + 4A + 1A - I = 0 \Rightarrow I = 7A$

### Wheatstone:

Wheatstone bridge is a circuit which is used to determine unknown resistance of a wire.

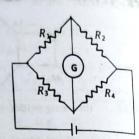

It's circuit diagram is shown in the figure:

**Balancing Condition** 1.  $\frac{R_1}{R_2} = \frac{R_3}{R_1}$  or  $\frac{R_1}{R_2} = \frac{R_2}{R_2}$ 

جرار المرافع ratio لا Adjacent resistances

2.  $R_1R_4 = R_2R_3$ 

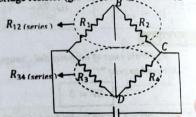

Product Copposite resistances

**Under Balancing Condition** 

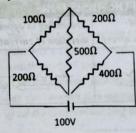

- > No current passes through the galvanometer and shows zero deflection.
- > Point B and D are at same potential.  $V_B = V_D$  and  $V_B - V_D = 0$
- $> R_1 R_4 = R_2 R_3$ اگر کوئی تین resistances معلوم ہوں تواس ے چو تھی کو معلوم کر یکے ہیں۔ چاہیے۔

To find equivalent resistance of the circuit bridge resistor (galvanometer) is removed

R₁₂ and R₃₄ are in parallel

Five resistors are connected with a 100V battery as shown in the figure below:

 $R_1R_4 = R_2R_3$ Solution:  $\Rightarrow 100 \times 400 = 200 \times 200$ 400 = 400

Balancing condition is satisfied

> No current passes through 500Ω

 $V_B = V_D$  or  $V_B - V_D = 0$ 

### Equivalent resistance:

 $R_{12}=100+200=300$  and  $R_{34}=200+400=600$  $Req = \frac{300 \times 600}{300 + 600} = 200\Omega$ 

# IINIT 08 >> ELECTROMAGNETISM

### Electromagnetism:

UNIT 08

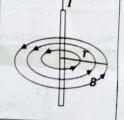

- > Branch of physics which deals with study of magnetic effects produced by motion of charges is called electromagnetism.
- If a magnetic compass is placed near current Note: When a steady current is carrying conductor, the magnetic field will passing through a conductor then deflect its direction.
- > In 1820 Orested discovered that current passing through a conductor produces magnetic field around the conductor

Inside the	Outside the
conductor	conductor
$E \neq 0$ but B	$B \neq 0$ but E
= 0	= 0

### Magnetic Field Due To Current Carrying Straight Conductor

- Magnetic field produced by current carrying straight conductor is circular (concentric circles)
- > Magnetic field lasts only as long as current is passing through conductor.
- > If 'I' is current passing through conductor then at any distance 'r' from the conductor magnetic field given as

Where  $\mu_o = 4\pi \times 10^{-7} Wbm^{-1}A^{-1}$  and known as permeability of free space.

Note r is distance from the conductor and it is not radius of wire of conductor.

- Direction of magnetic field depends upon direction of current and it is determined by right
- "Grasp the conductor in your right hand with thumb pointing in the direction of current then curling fingers represents the direction of magnetic field".

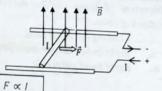

### FORCE ON CURRENT CARRYING CONDUCTOR IN A UNIFORM MAGNETIC FIELD

When a current carrying conductor is placed in magnetic field it will experience force given as

- Force on the conductor is directly proportional to current passing through conductor.
- > Force on the conductor is directly proportional to length of conductor inside the magnetic field
- Force on the conductor is directly proportional to external magnetic field.

> Force on the conductor is directly proportional to  $sin\theta$  where ' $\theta$ ' is angle between magnetic field and direction of current through conductor.  $F \propto sin\theta$ 

 $F \propto L$  $F \propto B$ 

### Magnetic Induction:

Magnetic induction is defined as magnetic force acting on one meter length of conductor, placed perpendicular to the magnetic field lines when one ampere current is passing through the conductor.

IL sino

- ➤ Its SI unit is Tesla  $(T = Nm^{-1}A^{-1} = kgm^{o}s^{-2}A^{-1})$
- > Its dimensions are  $[ML^{o}T^{-2}A^{-1}]$

### Tesla:

Magnetic induction is one tesla if one newton force is acting on one meter length of conductor placed perpendicular to magnetic field lines when one ampere current is passing

### Vector form:

Magnetic force on current carrying conductor in vector form is given as

- $\vec{F} = I(\vec{L} \times \vec{B})$ Magnetic force is always perpendicular to length of conductor and magnetic field lines
- Magnetic force is maximum when conductor is placed perpendicular to magnetic field  $F_{max} = ILB$
- Magnetic force is zero or minimum when conductor is placed parallel or anti-parallel to magnetic field lines.  $F_{min} = ILBsin0^{\circ} = 0$

Zayan Publishe

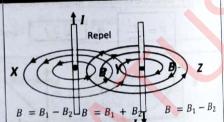

When two current carrying wires are placed near each other. When current is in opposite direction

- Wires attract each other.
- > Since direction of force is always from strong field to weak. Hence
- > Field is strong at X and Z

$$(B_{net} = B_1 + B_2)$$

Field is weak at Y

$$(B_{net}=B_1-B_2)$$

- > Wires repel each other.
- > Since direction of force is always from strong field to weak. Hence
- > Field is strong at Y

$$(B_{net}=B_1+B_2)$$

Field is weak at X and Z

$$(B_{net} = B_1 - B_2)$$

NMDCAT PREP BOOK

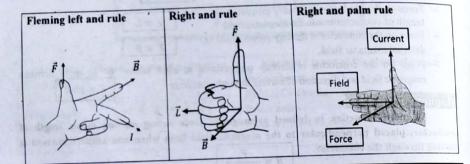

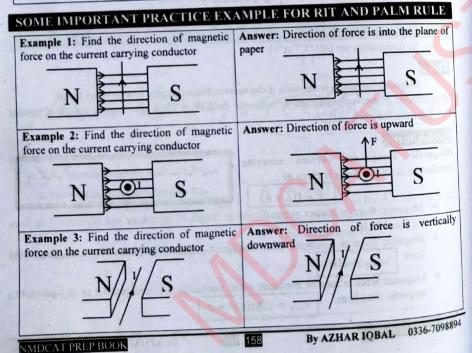

### Direction of Force:

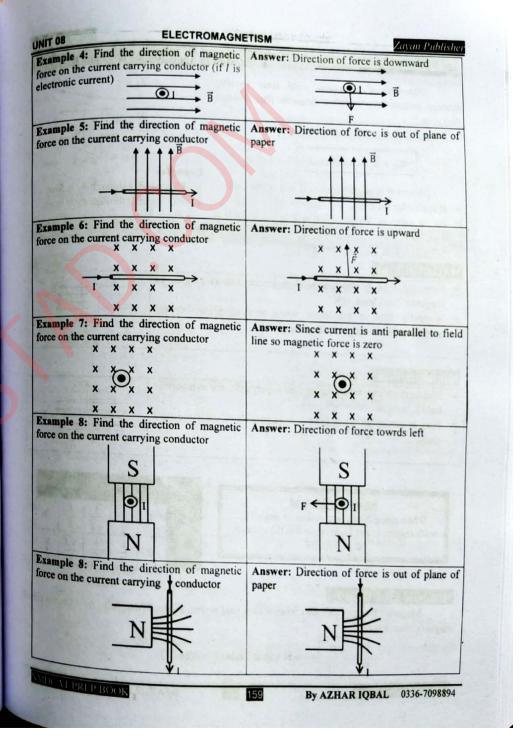

Direction of force can be determined following rules.

- i. Fleming left hand rule.
- ii. Right hand rule for cross product.
- iii. Right hand palm rule

### MAGNETIC FLUX

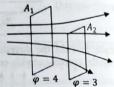

"Number of magnetic field lines passing through certain area is called magnetic flux through that area."

> Magnetic flux is denoted by ØB and

$$\phi_B = \vec{B} \cdot \vec{A} = BA \cos\theta$$

(Where  $\theta$  is angle between  $\vec{B}$  and vector area)

- > It is a scalar quantity.
- > Its SI unit is Weber  $(Wb = T: m^2 = NmA^{-1} =$  $kam^2s^{-2}A^{-1}$ ).
- ightharpoonup Its dimensions are  $[ML^2T^{-2}A^{-1}]$ .

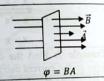

#### Example:

- > Flux passing through A₁ is four.
- > Flux passing through A2 is three.

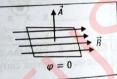

### **Maximum Flux:**

- > Magnetic flux is maximum when vector area is parallel to magnetic field lines. OR
- > Magnetic flux is maximum when area or plane is held perpendicular to magnetic field lines.

### Minimum Flux:

- > Flux is minimum when vector area is perpendicular to magnetic field lines. OR
- > Flux is minimum when area is held parallel to magnetic field lines.

### Short Cut Method

When plane or surface makes an angle ' $\theta$ ' with magnetic field lines then use the relation.  $\emptyset = BAsin\theta$ 

θ	00	$30^{o}$	45°	60°	90°
Cosθ	1	$\frac{\sqrt{3}}{2}$	$\frac{1}{\sqrt{2}}$	$\frac{1}{2}$	0
Sinθ	0	$\frac{1}{2}$	$\frac{1}{\sqrt{2}}$	$\frac{\sqrt{3}}{2}$	1

### Magnetic Flux Density:

Magnetic flux per unit area when area is held perpendicular to magnetic field lines is called magnetic flux density

$$B = \frac{\emptyset}{A_1}$$
  $\Rightarrow$  SI unit is Tesla  $(T = Wbm^{-2})$ 

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

### AMPERE'S LAW

**ELECTROMAGNETISM** 

> Ampere's law is stated as

"Sum of all the quantities  $(\vec{B}, \Delta \vec{L})$  for all path elements into which complete loop has been divided is equal to \(\mu_o\) times the total current enclosed by loop"

$$\sum_{i=1}^{n} (\vec{B}.\Delta \vec{L})_{i} = \mu_{o}I$$

Where  $\mu_0$  is permeability of free space and  $\mu_0 = 4\pi \times 10^{-7} Wbm^{-1}A^{-1}$ 

Ampere's law is used to determined magnetic flux density.

### FIELD DUE TO A CURRENT CARRYING SOLENOID

### Solenoid:

"Solenoid is a long, tightly wound cylindrical coil which behaves like a bar, magnetic when current passes through it."

Magnetic field outside the solenoid is non-uniform and weak (can be neglected).

Magnetic field produced at the ends of solenoid is non-uniform and

 $B_{end} = \frac{\mu_o nl}{2} \left( B_{end} = \frac{B_{center}}{2} \right)$ 

> Magnetic field produced inside the solenoid strong and nearly uniform.

Where n is number of turns per unit length

- Number of turns of solenoid  $(B \propto N)$
- Current passing through solenoid  $(B \propto I)$
- Length of solenoid  $\left(B \propto \frac{1}{l}\right)$
- Nature of core material (by increasing iron core inside the solenoid magnetic field

 $\mu_o NI$ 

# Three important cases:

- 1. If solenoid is stretched then its length increases but no. of turns remains same so magnetic
- 2. If solenoid is compressed then its length decreases but no. of turns remains same so its magnetic field increases
- 3. If solenoid is cut into two parts and same current passes through each part then magnetic field with become half field will remain same because both no. of turns and length become half.

# FORCE ON MOVING CHARGE IN A MAGNETIC FIELD

> Force acting on a current carrying conductor in magnetic field is actually force acting on moving charges.

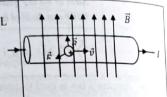

No. of charge carriers per unit volume =n

No. of charge carriers in volume AL of the conductor = n A L

Charge on each particle = q

Total charge in the conductor of volume AL = nqAL Time taken by charges to pass through conductor  $=\frac{L}{L}$ 

Current passing through the conductor =  $\frac{nqAL}{L} = nqAv$ 

When charges are moving in the magnetic field they experiences the magnetic force and the resultant of magnetic forces acting on moving charges is the magnetic force acting on current carrying conductor

▶ If a charge q is moving with velocity v in a magnetic field B is given as

 $F = avBsin\theta$ 

 $\theta$  is angle between  $\vec{v}$  and  $\vec{B}$ 

> Magnetic force depends upon

Charge of the particle

Fxq

NOTE: Magnetic force on moving charges is independent of length area or dimensions of the conductor.

Velocity of the particle  $F \propto v$ 

Magnetic field  $F \propto B$ (iii).

Direction of motion of charged particle. (iv).

 $F \propto \sin\theta$ 

Force acting on a moving charge is maximum when charge is moving perpendicular to magnetic field lines.

 $F_{max} = qvBsin90^o = qvB$ 

### Minimum Force:

Force acting on a particle is zero or minimum when

- Charge is zero (neutral particle)  $\Rightarrow F = (0)vBsin\theta = 0$
- Charged particle is at rest (v = 0),  $\Rightarrow F = q(0)Bsin\theta = 0$
- Magnetic field is zero (B = 0),  $\Rightarrow F = qv(0)\sin\theta = 0$
- Charge is moving either parallel or anti-parallel to magnetic field lines.

 $F = qvBsin\theta^{\circ} = qvBsin180^{\circ} = 0$ 

### Vector Form:

Magnetic force on moving charge in vector form is given as

$$\vec{F} = q(\vec{v} \times \vec{B})$$

Magnetic force is always perpendicular to velocity of charge and magnetic field. By AZHAR IQBAL 0336-7098894

NMDCAT PREP BOOK

Work done by magnetic force is always zero

(: Fm is perpendicular to velocity and displacement).

**ELECTROMAGNETISM** 

- Magnetic force is only deflecting force and it cannot accelerate or decelerate the charge.
- When charge in moving in uniform magnetic field its speed, K.E, angular velocity, time period, frequency and angular momentum remain constant.
- Angular acceleration and torque by magnetic force is zero.
- Only direction of velocity, momentum, acceleration and magnetic force are changing.

### Direction of Force:

Direction of force acting on a moving charge

in a magnetic field is determined by

- Right hand palm rule
- Fleming left hand rule

بادر مي اگر جارج + ve كى باك عا-موتو right كى استعال کری

### How to Apply Right Hand Palm Rule

S ب سے پہلے Right hand کھٹر بنائیں۔ 6۔ Fingers کا direction کیلا کی طرف Sel کی ہے۔ 7۔ ہاتھ کا Rotate کر کے Rotate کی طرف Set کے مطرف Force میں معمل کرے گا۔ 8۔ توجی طرف Force میں Sedirection کی اس طرف Force میں کا معمل کرے گا۔

UNIT 08 ELECTROMAGNETISM

# TRAJECTORY OF A CHARGE PARTICLE IN MAGNETIC FIELD

### 1. Straight Path:

### 2. Circular Path:

Radius of circular path	Angular frequency OR Angular Velocity	Time Period	Frequency
$r = \frac{mv}{qB}$	$\omega = \frac{qB}{m}$	$T = \frac{2\pi m}{qB}$	$f = \frac{qB}{2\pi m}$

### 3. Helical path:

When charge is moving neither parallel, antiparallel or perpendicular  $(\theta \text{ is other than } 0^o, 90^o \text{ or } 180^o)$ 

then its trajectory is helical or helix.

# COMPARISON BETWEEN ELECTRIC AND MAGNETIC FORCE

Electric Force	Magnetic Force
1. Electric force is given as $\vec{F}_e = q\vec{E}$ .  2. Electric force only depends upon charge and electric field and independent of velocity and direction of motion.  3. Electric force is given as $\vec{F}_e = q\vec{E}$ .	Velocity mannatin field and direction of
of electric field.	Magnetic force is always perpendicular to direction of magnetic field and velocity.
deflect the charge.	Magnetic force is only deflecting force and cannot accelerate or decelerate the charge.

165

AT PREP BOOK

#### Zayan Publishe

### LORENTZ FORCE

"If a charge q is moving with velocity v in a region where electric field is E and magnetic field is  $\vec{B}$  then the net force on the charge is vector sum of electric force  $\vec{qE}$  and magnetic force  $\vec{F} = a\vec{E} + a(\vec{v} \times \vec{B})$  $q(\vec{v} \times \vec{B})$ ."

It is known as Lorentz force.

### Velocity Selector:

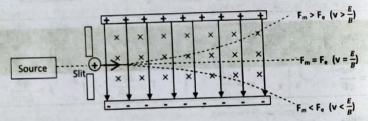

- $\vec{v}$ ,  $\vec{E}$  and  $\vec{B}$  are set mutually perpendicular.
- $ightharpoonup \vec{E}$  and  $\vec{B}$  are applied in a such a way that they may exert force on moving charge in opposite direction.
- > Only these charges passes undeviated for which

$$F_m = F_e$$

$$qvBsin90^o = qE$$

$$v = \frac{E}{B}$$

Solution:

Example: Alpha particles ranging in speed from 1000ms⁻¹2000 ms⁻¹ enter into a velocity selector where electric field intensity is 300 Vm⁻¹ and magnetic induction is 0.20T. The particles which move undeviated will have speed

(a)1000 ms⁻¹ (b) 1250 ms⁻¹ (c) 1500 ms⁻¹ (d) 2000 ms⁻¹

Example: A velocity selector has magnetic field of 0.30Tand a perpendicular electric field of 10000Vm⁻¹ is applied .Then the particles which move undeviated will have speed

(a)330 ms⁻¹

(b) 3300 ms⁻¹ (c)33000 ms⁻¹ (d) 3000 ms⁻¹

 $v = \frac{300}{0.2} = 1500 \text{ ms}^{-1}$ 

**Example:** If a charge q is moving in a velocity selector. The charge will move in a straight path if:

- $(a)v = \frac{E}{R}$
- (b) E is perpendicular to B.
- (c)  $F_m = F_e$
- (d) All of these

### CHARGE TO MASS RATIO OF AN ELECTRON

- Charge to mass ratio  $\left(\frac{q}{m}\right)$  of a particle only depends upon nature of particle.
- In case of neutron or any other neutral particle  $\frac{q}{r} = 0$  and  $\frac{m}{r} = \infty$
- $\Rightarrow \left(\frac{q}{m}\right)_{electron} > \left(\frac{q}{m}\right)_{proton} > \left(\frac{q}{m}\right)_{q=particle}$

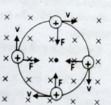

### Determination of Charge to Mass Ratio of an Electron

- > To determined charge to mass ratio of electron beam of electrons is projected in uniform magnetic field in perpendicular direction.
- Magnetic field exerts the force on electrons and bends the beam in a circular path.

$$F_m = F_c$$

$$qvB = \frac{mv^2}{r}$$

$$\frac{q}{m} = \frac{v}{Br}$$

- > To determine the radius of circular path beam of electrons is projected in a glass bulb filled with H₂ gas at low pressure due to ionization and de-excitation path of electrons becomes

> If beam of electrons is accelerated through potential difference V then Gain in Momentum: Gain in Velocity: K.E = aV $P = \sqrt{2maV}$ 2qV

- > Putting value of V in eq(i)
- Accurately Known value of e/m for electron is  $1.7588 \times 10^{11} Ckg^{-1}$ .

Example: A charge particle is moving in a circular path in a perpendicular magnetic field. By increasing the magnetic field charge to mass ratio of the particle will: (a)Increase

ADCAT PREP BOOF

(b) decrease

(c)Remain same√ (d) None

167

Solution:

Charge to mass ratio only depends upon nature of particles.

UNIT  $09 \rangle\rangle$ 

## **ELECTROMAGNETIC** INDUCTION

### Electromagnetic Induction:

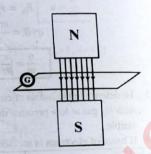

"Changing magnetic flux through a coil induces emf this phenomenon is known as electromagnetic induction."

### Induced emf:

Michael Faraday discovered that when magnetic flux linking with conductor changes an emf is produced in the conductor this emf is known as induced emf.

### **Examples:**

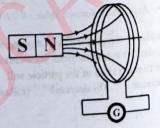

- 1. Consider a coil placed between the two poles of a magnet.
  - When coil is stationary no current or emf is induced because magnetic flux is not changing.
  - When coil is moved along the field lines again no emf is induced because magnetic flux is not changing.
  - When coil is moved across (perpendicular) to field lines, magnetic flux changes and emf is induced.

10000	Induced emf :	and in	duced current depends upon
i	Speed of the coil $(\varepsilon \propto v)$ .	ii.	Applied magnetic field intensity $(\varepsilon \propto B)$ .
iii.	Number of turns of the coil	iv.	Induced emf is independent of resistance of
111.	$(\varepsilon \propto N).$		the coil. But induced current depend
	(2 % 11).		resistance $(1 \propto \frac{1}{R})$ .

### 2. Consider a stationary coil and a bar magnetic is moved near the coil.

- > When magnet is at rest no emf is induced because magnetic flux is not changing.
- When magnet is moved towards the coil magnetic flux increases and an emf is induced.
- > When magnet is moved away magnetic flux decreases and an emf is induced.

**ELECTROMAGNETIC INDUCTION** 

### Zayan Publishe

### 3. Consider a circular coil placed in a magnetic field directed into the plane of paper.

- > Since area of the loop is constant hence magnetic flux is constant and no emf is induced in the coil.
- When coil is distorted its area decreases thus magnetic flux through the coil decrease and an emf is induced.

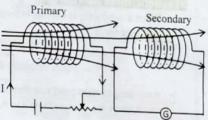

- Consider a rotating coil placed in uniform magnetic field directed into plane of paper.
  - When coil is rotated in magnetic field angle between field lines and vector area changes thus magnetic flux changes and an emf is induced.

### 5. Consider a primary coil connected with battery and rheostat and coil connected with a galvanometer is placed near it as secondary.

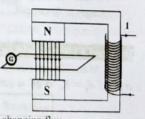

- > When current through primary coil is constant magnetic flux through secondary coil is also constant thus no emf is induced in secondary.
- > When current through primary coil increases, magnetic flux through secondary coil increases and emf is induced in secondary coil.

> When current through primary coil decreases, flux through secondary coil also decreases thus an emf is induced in secondary coil.

### 6. Consider coil is placed in the magnetic field of electromagnet

- ▶ When current through electro-magnet is constant no emf is induced because magnetic flux is not changing.
- When current through electromagnet increases, magnetic flux increases thus an emf induced due to changing flux.
- When current through electromagnet decreases. magnetic flux decreases thus an emf is induced due to changing flux.

MDCAT PREP BOOK

### MOTIONAL EMF

"Emf induced by motion of the conductor across the magnetic field is called motional emf."

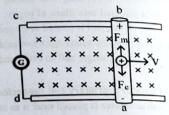

### Dynamic Induced emf:

Emf induced in a conductor when it is moved in stationary magnetic field.

### Statically induced emf:

Emf induced in a conductor when conductor is stationary and magnetic field is moving or charge.

Consider a conductor of length L placed on two rails connected with a galvanometer, a uniform. Magnetic field B is applied into plane of paper and rod is moving with uniform velocity v.

### Magnetic force on charges:

> When a conductor is moving in magnetic field charges inside the conductor experience magnetic force.

$$F_m = qvBsin\theta = qvBsin90^o \quad (:v \perp B)$$

$$F_m = qvB$$

> According to right hand rule direction of magnetic force on +ve charges is directed upward and it move the charges from a to b.

### Electric force on charges:

> +ve charges are concentrated at point 'a' and -ve charges are concentrated at point 'b' these +ve and -ve charges induces an electric field E which exerts an electric force on the +ve charges in downward.  $\vec{F} = a\vec{E}$ 

### Induced Electric field in Conductor:

At equilibrium electric force will be come equal to magnetic force and net force on charge

is zero. 
$$F_e = F_m \Rightarrow qE = qvB$$

$$E = vB$$

- > Induced electric field depends upon:
  - Speed of conductor  $(E \propto v)$
  - External magnetic field  $(E \propto B)$

### Induced Potential Difference:

$$\Delta V = -E\Delta r = -vBL$$

$$\Delta V = -vBL$$

- Induced electric field depends upon:
- Speed of conductor  $(\Delta V \propto v)$
- Length of conductor inside the magnetic field (ΔV α L).
- External magnetic field.  $(\Delta V \propto R)$

### Induced emf in the conductor:

$$induced\ emf = induced\ p.d$$

$$\varepsilon = -vBL$$

### Induced Current:

ELECTROMAGNETIC INDUCTION

If R is resistance of the current loop abcd then induced current is given as

$$I = \frac{vBL}{R}$$

### Induced Charge:

Amount of induced charge in the conductor in a time interval  $\Delta t$  is given as

$$\Delta Q = I\Delta t = \frac{vBL\Delta t}{R}$$

If the angle between velocity of conductor and magnetic field lines is  $\theta$  instead of 90° then Induced electric field:

$$E = -vBsin\theta$$

Induced potential difference:

$$\Delta V = -vBLsin\theta$$

Induced emf:

$$\varepsilon = -vBLsin\theta$$

### Induced emf depends upon

(i). Speed of the conductor

$$(\varepsilon \propto v)$$

Length of conductor inside the field  $(\varepsilon \propto L)$ 

(iii). External magnetic field

$$(\varepsilon \propto B)$$

(iv). Angle between velocity of conductor and magnetic field lines.

$$(\varepsilon \propto Sin\theta)$$

### Maximum emf:

Induced emf is maximum when conductor is moving perpendicular to field lines.

$$\varepsilon = vBLsin90^{\circ}$$

$$\varepsilon_{max} = vBL$$

### Minimum emf:

Induced emf is minimum when conductor is moving along (parallel or anti-parallel) to field lines.

$$\varepsilon = vBLsin0^{\circ} = 0$$

Solution:

### Example:

An emf of 0.5 V is induced between the ends of a metal bar moving through a magnetic field of 0.20 T. What field strength would be needed to produced an emf of 1.5 V between the ends of the bar. If all other factors remain same. (a) 0.3 T (b) 0.6 T (c) 0.9 T (d) 1.2 T

 $(\varepsilon \propto B)$  $B_2 = \frac{1.5 \times 0.2}{0.5} = 0.6 T$ 

### FARADAY LAW

"Average induced emf in a coil of 'N' turns is equal to - ve of rate of change of magnetic flux through the coil."

#### Explanation:

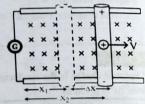

Consider a rod is moving on two rails connected with a galvanometer in presence of magnetic field. As area of loop increases magnetic flux changing through the flux and emf is induced.

$$\varepsilon = -vBL$$

$$\varepsilon = -\frac{\Delta x}{\Delta t}BL$$

$$\varepsilon = -\frac{\Delta A}{\Delta t}B$$

$$\varepsilon = -\frac{\Delta \phi}{\Delta t}$$

یادر محیل Magnetic flux کو تین طرحے change کیاجا سکا ہے۔

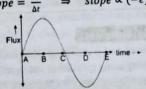

Magnetic فيلذ اور Area ك ور ميان Angle كو

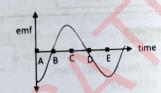

change فیلڈ Magnetic

=2/ change Area

### > Induced emf depends upon

- Number of turns of the coil  $(\varepsilon \propto N)$ .
- Rate of change of flux through the coil  $\left(\varepsilon \propto \frac{\Delta \emptyset}{\Delta t}\right)$
- > Faraday law is used to determine amount of induced emf or induced current.
- ➤ Slope of Ø t graph is directly proportional to induced emf.
- As slope =  $\frac{\Delta \emptyset}{\Delta \theta}$  $\Rightarrow$  slope  $\propto (-\varepsilon)$

- At instants A and E slope of  $\emptyset t$  graph is +ve maximum. So emf is -ve maximum.
- At instants B and D slope of  $\emptyset t$  graph is zero emf also zero.
- At instant C slope of Ø − t graph is -ve maximum. So emf is +ve maximum.

### Information

Faraday's designed a Homopolar generator with which he was able to produce continuous induced current.

172

(ii).

- i Schange

### **ELECTROMAGNETIC INDUCTION**

### Zayan Publishe

### DIFFERENT FORMS OF FARADAY LAW

1. If a plane is perpendicular to field lines  $\emptyset = BA \cos 0^\circ = BA$ 

- (i) When B = constant and area is changing then
- $\Delta \emptyset = B\Delta A$  and

- (ii) When A = constant and B
- is changing then  $\Delta \emptyset = (\Delta B)A$  and

# $(\Delta B)A$

- 2. If a plane is not perpendicular to field lines  $\emptyset = BA \cos 0^o = BA$ 
  - (i) When B = constant and area is changing then

$$\Delta \emptyset = B \Delta A \cos \theta$$

and 
$$\varepsilon = N \frac{B\Delta A Cos\theta}{\Delta t}$$

(ii) When A = constant and Bis changing then

and 
$$\varepsilon = N \frac{(\Delta B)ACos\theta}{\Delta t}$$

### Induced Current:

If R is resistance of the coil then induced current is given as  $I = \frac{\varepsilon}{2}$ 

or 
$$I = N$$

### Induced current depends upon

- (i). No. of turns of coil (1 & N)
- Rate of change of flux  $\left(I \propto \frac{\Delta \emptyset}{\Delta t}\right)$ .
- (iii). Resistance of coil  $\left(I \propto \frac{1}{p}\right)$

### Induced Charge:

Induced charge in a time interval  $\Delta t$  is given as

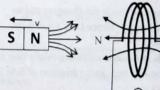

$$\Delta Q = I\Delta t = \frac{N\Delta \phi}{R\Delta t} \times \Delta t \qquad OR \qquad \Delta Q = \frac{N\Delta \phi}{\Delta R}$$

### LENZ'S LAW

Lenz pointed out that –ve sign in faraday law  $\left(\varepsilon = -N\frac{\Delta\theta}{\Delta t}\right)$  indicates that

"The direction of induced current is always so as the oppose that change which causes the current".

- Whenever magnetic flux changes a current is induced which produces a magnetic field that opposes the change in flux.
  - When flux increases it tends to decreases flux.
  - When flux decreases it tends to increase the flux

NOTE:

Lenz's law is in according to law of conservation of energy.

NOTE: Lenz's law is used to determine the polarity of induced emf or direction of induced current.

### HOW TO DETERMINE DIRECTION OF INDUCED CURRENT

Case-I When distance between coil and magnetic is increasing or decreasing.

# Example 1: Magnet is moving away from coil

Steps Steps Steps اگر دور جارے ہول توان میں attraction پیداہو گی۔

### LEN'Z LAW AND CONSERVATION OF ENERGY

Lenz's law is consistent with law of conservation of energy, whenever current is induced by motion of coil or magnet they experience a magnetic force which opposes the motion of coil or magnet. Thus mechanical energy spent to overcome opposition is converted into electrical energy.

#### NOTE

When current is induced in a conductor due to its motion it experiences magnetic force opposite to velocity.

#### NOTE

- Whenever magnetic flux increases. magnetic force is repulsive.
- Whenever magnetic flux decreases, magnetic force is attractive.

### MUTUAL INDUCTION

"When current passing through primary coil changes an emf is induced in secondary coil this phenomenon is known as mutual induction".

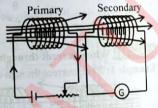

> Flux Ø passing through each turn of secondary coil is directly proportional to current through the primary  $N_s \emptyset_s \propto I_p$ coil.

 $N_s \Delta \emptyset = M \Delta I_n$ 

### Mutual inductance:

"Ratio of average induced emf in secondary coil to rate of change of current through primary coil is called mutual inductance."

Its SI unit is Henry  $(H = VsA^{-1})$ 

- Mutual inductance depends upon:
  - Number of turns of coils. (i).
  - (ii). Area of the coils.
  - (iii). Closeness and orientation of coils.
  - (iv). Nature of core material.

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

### SELF INDUCTION

"When current passing through the coil changes an 'emf is induced in the coil itself".

Flux passing through each turn of the coil is directly proportional to current passing through coil.

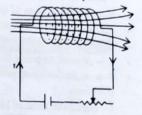

NØXI

NØ = LI

and

 $N\Delta\emptyset = L\Delta I$ 

Lis proportionality constant and it is known as self inductance

#### Self Inductance

Ratio of average induced emf in the coil to rate of change of current through the coil.

> Its SI unit is henry  $(H = V s A^{-1})$ 

Self inductance depends upon

- Shape and number of turns of coil
- Nature of core material (ii).
- Area and length of the coil

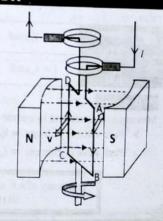

#### Information

Induction heater operates on the principle of electromagnetic induction. The water placed on it in the metal pot is boiling whereas that in the glass pot is not. Even the glass top of the heater remain cool to touch. The coil just beneath the top carries ac that produces changing magnetic flux. Flux linking with pots induce emf in them, Current is generated only in the metal pot that heats up the water.

### A.C GENERATOR

"A device which converts mechanical energy into electrical energy is called generator."

- > Generator works on the principle of Faraday law of induction. When coil rotates in magnetic flux changes through coil and an emf is induced in the coil.
- Emf is only induced along the conductor AB and CD because force acting on the charges is along the wire.
- Emf induced along the conductor BC and DA is zero because force on charges is not along the Wire

DCAT PREP BOOK

### Induced Emf:

Emf induced in generator is dynamically induced emf and it is given as

$$\varepsilon = N\omega ABsin\theta$$

$$\varepsilon = \varepsilon_0 \sin\theta$$

- · N is number of turns of the coil.
- ω is angular velocity with which coil is rotated.
- · A is area of the coil.
- B is external magnetic field in which coil is rotated.
- $\theta$  is angle between velocity of coil and magnetic field lines.
  - Maximum induced emf is given as

$$\varepsilon = N\omega AB$$

$$\varepsilon_o = N(2\pi f)AB$$

$$\varepsilon_o = N\left(\frac{2\pi}{T}\right)A$$

### Induced Current:

Induced current is given as I =

 $I = I_{\alpha} \sin \theta$ 

Current and voltage produced by A.C generator are continuously changing with time.

Where 
$$I_o = \frac{\varepsilon_o}{R} = \frac{N\omega AB}{R}$$

### In one revolution of generator one cycle of A.C

- > Current reverses its direction once.
- Current reaches to maximum value twice.
- Current reaches to zero value twice.
- > Emf or voltage reverses its polarity once.

### Instantaneous value:

Value of alternating current or voltage at any particular instant of time is called instantaneous

value.		AND RESIDENCE STREET		Ζπ
Instantaneous voltage	$V = V_o sin\theta$	$V = V_o sin\omega t$	$V = V_o \sin 2\pi f t$	$V = V_0 \sin \frac{\pi}{T} t$
Instantaneous	$I = I_o sin\theta$	$I = I_o sin\omega t$	$I = I_o \sin 2\pi f t$	$I = I_o \sin \frac{2\pi}{T} t$

### Peak value:

Maximum value reached by current or voltage in a cycle is called peak value.

- $\triangleright$  Peak value of voltage =  $V_o = N\omega AB$
- Peak value of current =  $I_o = \frac{V_o}{R} = \frac{N \omega AB}{R}$

Frequency of A.C used in Pakistan is 50 Hz.

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

### ELECTROMAGNETIC INDUCTION

Zayan Publisher

### UNIT 09 Peak to peak value:

Sum of +ve peak value and -ve peak value is called peak to peak value.

- $V_{p-p} = V_o + V_o = 2V_o$
- $> l_{p-p} = l_o + l_o = 2l_o$

### Root mean square value:

Effective value of alternating current or voltage obtained by taking square root of mean square value is called root mean square value.

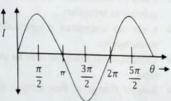

For voltage	For current
$V_{rms} = \frac{V_o}{\sqrt{2}} = 0.7V_o$	$I_{rms} = \frac{I_o}{\sqrt{2}} = 0.7I_o$
$OR V_o = \sqrt{2} V_{rms} = 1.4 V_{rms}$	OR $I_o = \sqrt{2} I_{rms} = 1.4 I_{rms}$

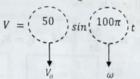

### Phase:

Angle  $\theta$  which specifies the instantaneous value of alternating current or voltage is called phase.

- When  $\theta = i\pi$  current is zero
- When  $\theta = \frac{odd\pi}{2}$  current is maximum.

Example: If the expression for alternating voltage is  $V = 50 \sin 100\pi t$ . Then by comparing with the standard equation  $V = V_0 \sin \omega t$  we can find the following as

	D			-0	w
Peak value	Peak to peak value	rms value	Angular frequency	Frequency	Time period
V _o = 50V	$V_{p-p} = 2V_o$ $= 100V$	$V_{rms} = \frac{V_o}{\sqrt{2}}$ $= 0.7 \times 50$ $= 35V$	$\omega = 100\pi$	$f = \frac{\omega}{2\pi}$ $= 50Hz$	$T = \frac{1}{50}$

If alternating voltage is given as  $V = 350 \sin 100\pi t$  then rms value of voltage will be

- (a) 175V
- (c) 350V

- (b) 700V
- (d) 240V

### Solution:

 $V = 350 \sin 100 \pi t$ 

 $V_0 = 350V$ 

 $V_{rms} = \frac{V_o}{\sqrt{2}} = 0.7 \times 350$ 

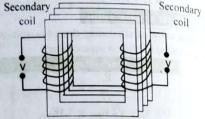

= 240V

AIDCA I PREP BOOK

### TRANSFORMER

"Transformer is a device which is used to change a given alternating emf into larger or smaller alternating emf".

> Transformer works on principle of mutual induction. Alternating current passing through primary creates a continuously changing magnetic flux through secondary that induces an emf in secondary.

> Transformer only works on A.C and never on D.C.

- > Coils of transformer are not connected electrically so there is no transfer of charge from primary to secondary.
- > Coils are connected magnetically and power is transferred from primary to secondary magnetically.
- > Coils of transformer are over an soft iron laminated core which concentrates the magnetic field
- Rate of change of flux through each cell must be same

Then

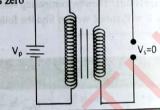

Then
$$V_p = N_p \frac{\Delta \emptyset}{\Delta t} \quad and \quad V_s = N_s \frac{\Delta \emptyset}{\Delta t}$$

$$OR \quad \boxed{\frac{V_s}{V_p} = \frac{N_s}{N_p}}$$

Where  $\frac{N_s}{N}$  is known as transformation ratio.

Note:

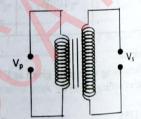

When a D.C source (battery) is connected with primary then output voltage and power are always zero

### Step-up transformer:

A transformer which is used to change a given alternating emf into larger alternating emf.

- $\triangleright$  Increases the voltage level  $(V_s > V_p)$
- $\triangleright$  Decreases the current level  $(I_s > V_p)$
- $\triangleright$  Power level remains same  $(P_{in} = P_{out})$
- > Time period or frequency of A.C remains same.

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

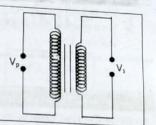

### **ELECTROMAGNETIC INDUCTION**

Zayan Publishe

### UNIT 09 step-down transformer:

A transformer which is used to change a given alternating emf into smaller alternating emf.

- > Ns < Np
- > Decreases the voltage level  $(V_s < V_s)$
- > Decreases the current level  $(I_s > V_s)$
- Power level remains same  $(P_{in} = P_{out})$
- > Time period or frequency of A.C remains same

### Ideal transformer:

A transformer in which output power is equal to its input power  $(P_{loss} = 0)$  is known as ideal

$$P_{in} = P_{out}$$

$$V_p I_p = V_s I_s$$

$$OR \qquad \frac{V_s}{V_p} = \frac{I_p}{I_s}$$

$$OR \qquad \frac{I_s}{I_p} = \frac{N_p}{N_s}$$

If a primary coil of a transformer is connected to A.C mains then  $V_p = Constant$  $I_p \propto P_{out}$ 

### Use of Transformer in Power Transmission:

- > If R is resistance of transmission line then power loss in transmission line due to heating
- > The power loss can be reduced by decreasing current level.
- > Step-up transformer is used at power generating stations.
- > Power is transmitted at high voltage and at low current and thus power loss in transmission line is considerably reduced.
- At other end a step-down transformer is used to decrease the voltage level and increases

# fficiency of Transformer:

The ratio of output power to input power is known as efficiency of transformer

$$\eta = \frac{P_{out}}{P_{in}} \times 100$$

MDCAT PREP BOOK

181

For a practical transformer due to power losses in transformer  $P_{out} < P_{in}$  and efficiency is

less than 100%

### Power loss in Transformer:

### 1. Eddy Current Loss:

"When a metal conductor is placed in a changing magnetic field a current is induced in metal conductor this current is known as eddy current".

- > Some power is lost in form of heat due to eddy current produced in the core of transformer.
- > To reduce the eddy current loss core should be assembled with laminated plates of iron.

### 2. Hysteresis loss:

"Energy expended to magnetise and demagnetize the core material in each cycle of A.C is called hysteresis loss".

- > Some power is lost to magnetise and demagnetize the core again and again.
- > To reduce the hysteresis loss soft iron core should be used having narrow hysteresis loop.

#### 3. Cu loss:

- > When current passes through primary and secondary of transformer some power is lost due to the resistance of coils  $(P = I^2 R)$
- > To reduce the Cu loss thick Cu wire is used for winding.

### 4. Magnetic Flux Leakage:

- Flux passing through primary is not completely linked with secondary.
- To reduce this loss secondary coil is kept inside the primary coil by using "E shaped" plates of iron core.

**UNIT 10** >>

UNIT 10

# **ELECTRONICS**

A review of P-type and n-type semiconductors

### P-type semi conductor

- > Trivalent (III-group) impurity atoms are added in pure semi-conductor.
- > Trivalent atoms are known as acceptor atoms e.g. B, Al, Ga, etc.
- > Majority charge carriers are holes.
- Minority charge carriers are electron.
- > Holes move from high potential to low potential.
- Mobility of holes is low

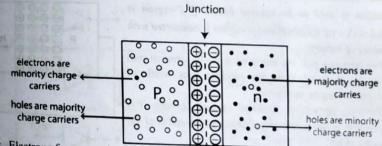

### n-type semiconductor

- > Penta-valent (V-group) impurity atoms are added in pure semi-conductor.
- > Penta-valent atoms are known as donor atoms e.g. P, Bi, Sb, Sn etc.
- > Majority charge carriers are electrons.
- Minority charge carriers are holes.
- > Electrons move from low potential to high potential.
- > Mobility of electrons is high.

### **ELECTRONICS**

**ELECTRONICS** 

"When a crystal of Si or Ge is grown in such a way that one half is doped with trivalent impurity and other half is doped with pentavalent impurity p-n junction is formed."

Electrons from n-region diffuse to p-region thus a layer of +ve immobile ions is formed in p-and n-region and around the junction.

### Depletion Region:

- "Region produced across the junction containing immobile ions and no charge carriers is called depletion region."
  - Depletion region contain immobile (stationary) ions which do not act as charge carriers.

# Potential barriers OR Knee Voltage:

"Potential difference produced across the junction which stops the diffusion of electrons is called potential barrier or knee voltage."

Potential barriers is 0.3V for germanium and 0.7V for silicon.

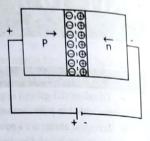

AMDCAT PREP BOOK

### Forward biases P-n junction

"p-n junction is said to be forward biased if P-region is connected with +ve and n-region with -ve terminal of battery."

- > +ve terminal repel the holes towards the junction and ve terminal repel the electrons towards the junction thus width of depletion region decreases.
- > When applied voltage is greater than potential barrier electrons and holes crosses the junction and a current starts flowing through P-n junction.

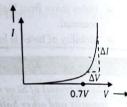

- > Forward current is due to majority charge carriers and is order of mA.
- > Maximum current limit for a junction is decided by power.

### Forward Resistance:

Resistance of P-n junction when it is forward biased is called forward resistance.

$$r_f = \frac{\Delta V}{\Delta I}$$

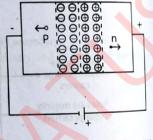

(its value is very small in few ohms)

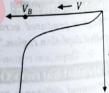

### Reverse biased P-n junction:

P-n junction is said to be reverse biased if P-region is connected with - ve terminal and n-region is connected with +ve terminal of battery.

- > +ve terminal pull the electrons and -ve terminal pull the holes away from the junction thus width of depletion region increases.
- > Reverse current or leakage current through P-n junction is due to minority charge carriers and is of the order of uA.

- > If reverse voltage is increased covalent bonds break and large number of electrons are released. This causes a sudden increase in current. This is called Zener effect.
- If reverse bias voltage is increased further, minority charge carriers attain high velocity and knock down the bound electrons from covalent bonds by collisions and current increases rapidly this is called Avalanche effect or avalanche break down.
- reverse resistance of P-n junction is very large and is of the order of mega-ohms.

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

**ELECTRONICS** Zayan Publisher

> Note: Net current through the junction is due to electrons and holes which is given by  $I = I_o + I_h$

### DIODE

A P-n junction is known as semi-conductor diode.

Arrow کرنٹ کی direction کو ظاہر کر رہی ہے مطلب Arrow والی direction کے کرنٹ گزر سکتا ہے اور دوسری direction

	Forward biased diode Examples	کرنے میں گزر سائے۔ Reverse biased diode Examples

2.	0V −3V	1V 4V
3.	3V 0V	-5V -2V
4.	-2V -5V	0V 3V

### RECTIFICATION

"Process of conversion of alternating current into direct current is called rectification."

- > Device which is used to convert A.C into D.C is called rectifier.
- Diode can be used as rectifier.
- > There are two types of rectification.
  - i. Half wave rectification

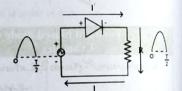

ii. Full wave rectification

### Half wave rectification:

- > "A type of rectification in which only one half of A.C is converted into D.C is called half wave rectification."
- > Minimum one diode is required for half wave rectification.

### During +ve half cycle:

- > Diode is forward biased.
- > Resistance of diode will become very small.
- > Output pulse is +ve.
- Voltage drop across the diode is approximately zero.
- > Voltage drop across the load resistance R is equal to source voltage.

اوروال A.C source اوروال +ves Terminal

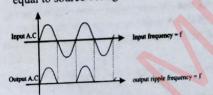

ii. اگر می کون output می او R _ Lost pulse +ve

### Note

Peak Inverse Voltage: (PIV) PIV is maximum reverse voltage that a diode rectifier can block in reverse biased state.

### During -ve half cycle:

- Diode is reverse biased.
- Resistance of diode will become very large.
- Output voltage is zero.
- Voltage drop across load resistance R is zero.
- Voltage drop across the diode is maximum equal to source voltage.

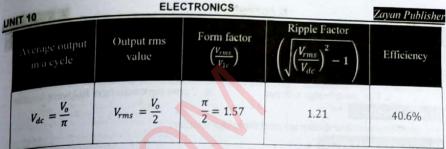

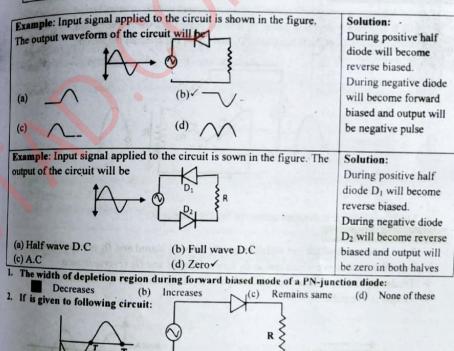

- If 'f' is frequency of input signal then output ripples also have
- If 'T' is time period of input signal then output ripples also have time period 'T'

By AZHAR IQBAL 0336-7098894

NMDCAT PREP BOOK

The output voltage during  $0 \rightarrow \frac{T}{2}$  will be:

- (a) Positive half Zero
- (b) Negative half
- 3. A full wave rectifier is being used to rectify an A.C voltage of 110 V, 60 Hz. The number of pulses of rectified current obtained in five seconds is:
- (a) 300 (b) 60 600 600 (c) 1 a full-wave center tap transformer rectifier, how many diodes conduct at a time? (d) 120 (c) 3

AT PREP BOOF

### Full Wave Rectification:

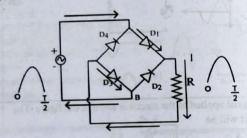

- > A type of rectification in which both halves of A.C are converted into D.C is called full wave rectification.
- > There are two types of full wave rectification. i. Full wave bridge rectifier.
  - ii. Center tap transformer full wave rectifier

### Bridge Rectifier:

> Minimum four diodes are used for bridge rectifier.

### During +ve half cycle:

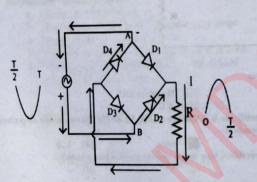

- ➤ Point A becomes +ve which makes D₁ forward biased and D₄ reverse biased.
- ➢ Point B becomes −ve which makes D₃ forward biased and dereverse biased.
- > Diodes D₁ and D₃ conducts but diodes D₂ and D₄ do not conduct the current.

Maximum voltage is dropped across the load resistance R.

### During -ve half cycle:

- ➤ Point A becomes which -ve which makes D₄ forward biased and D₁ reverse biased.
- > Point B becomes +ve which makes D₂ forward biased and D₃ reverse biased.
- Diodes  $D_2$  and  $D_4$  conduct but diodes  $D_1$  and  $D_3$  do not conduct the current.
- > Output is +ve pulse.

- If " is frequency of input signal then output ripples have frequency '2f'
- If T' is time period of input signal then output ripples have time period 'T/2'

(a) D ₁ and D ₄ conduct (c) D ₃ and D ₂ conduct	(b) D ₁ and D ₂ conduct (d) D ₄ and D ₃ conduct	D3 D4 R
Example: The output of the	e following circuit will be:	Solution: during +ve half  V.  During -ve half
(a) Pulsating full wave D.C (c) Sinusoidal A.C In both halves current throu	(d) zero	v.

1. The time period of the ripple at the output of the following circuit is:

2. In the following figure what happens for the negative half cycle of the input? (b) 20 ms

(a) D₁ and D₃ conduct D₁ and D₂ conduct

- D₄ and D₂ conduct
- (d) D4 and D3 conduct

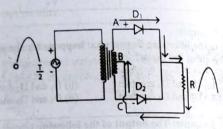

10 ms

# CENTER TAPE TRANSFORMER RECTIFIER

A center-tap transformer rectifier uses transformer with center-tapped secondary winding which splits the secondary voltage into two parts and two diodes which conduct alternatively.

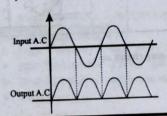

### During +ve half cycle:

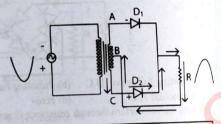

- ➤ Point A becomes +ve w.r.t B and diode D₁ becomes forward biased.
- Point C becomes -ve w.r.t B and diode D2 becomes reverse biased.
- > Only diode D₁ conduct the current.
- > Output is +ve pulse.

### During -ve half cycle:

- Point A becomes -v w.r.t B and diode D₁ becomes reversed biased.
- Point C becomes +ve w.r.t. B and diode D₂ becomes forward biased.
- > Only diode D₂ conducts the currents.
- > Output is a +ve pulse.

- If 'f' is frequency of input signal then output ripples have frequency '2f'
- If 'T' is time period of input signal then output ripples have time period 'T/2'

### Note

- A circuit which converts pulsating D.C into smooth D.C is called filter.
- Capacitor, inductor or their combination can be used as filter.

### Example:

If a full wave rectifier circuit is operating from 50 Hz mains, then the time period of output ripples will be:

- (a) 20 ms
- (b) 40 ms
- (c) 10ms
- (d) 30ms

#### Solution:

Input frequency = 50Hz Output ripple frequency =100 Hz

Output time period =  $\frac{1}{100}$  = 10ms

In case of center tape transformer full wave rectifier which of the following statement is true (b) only one diode conducts at a time (a) minimum two diodes are required

(c) frequency of output ripple is half of input signal

(d) all of these V

### Plank's Assumption:

"Energy is emitted or absorbed by atoms in discrete packets called quanta rather than as a continuous wave."

But according to classical electromagnetic theory of radiations energy was emitted or absorbed by atoms as a continuous wave. And energy is uniformly distributed over the wave.

Continuous Electromagnetic Wave

### Plank's Law:

Energy of each quantum is directly proportional to its frequency.

$$E \propto f$$

$$OR = hf$$

Note Angular momentum and Plank's constant have same units.

Where 'h' is plank's constant and

 $h = 6.626 \times 10^{-34} \text{ J.s or } h \approx 6.63 \times 10^{-34} \text{ J.s}$ 

- ➤ SI unit of Plank's constant is  $J.s = kgm^2s^{-1}$
- $\triangleright$  Dimensions of plank's constant are  $[ML^2T^{-1}]$

The graph between energy and frequency of photons is a straight line and its slope represent the Plank's constant.

- Atoms or molecules emit or absorb energy when they jump from one quantum state to another.

(Emitted or absorbed energy = difference in energy between two levels).

### PHOTON THEORY

"According to Einstein photons (discrete energy packets) are integral part of all the electromagnetic radiations."

- > These photons carriers energy and momentum.
- Photon cannot be subdivided (elementary particle).
- Rest mass of photon is zero.
- Charge on the photon is zero. Hence they are not affected by electric and magnetic field.
- y-radiation with energy about 1 MeV. Their quanta can be easily detected.
- Radio waves with energy about 10⁻¹⁰ eV. Their quanta cannot be detected and wave property of radio waves predominates.

### Cnorgy of Photon:

Energy of photon in terms of frequency is given as	Energy of photon in terms of W velength is given as	Energy of photon in terms of momentum is given as
E = hf	$E = \frac{hc}{\lambda}$	E = pc
Eαf	$E \propto \frac{1}{\lambda}$	E∝p
Slope = h	E	Slope = c

Short cut formula to determine energy of photon :

$$E = \frac{1240 \times 10^{-9}}{\lambda} eV$$

### Example:

Energy of blue light photon having wavelength  $\lambda = 400nm$  is

(c) 1.2 eV

(b) 3.1 eV√ (d) 2.1 e V

**Solution:**  $E = \frac{1240 \times 10^{-9}}{400 \times 10^{-9}}$  $=\frac{12.4}{4}eV=3.1 eV$ 

### Example:

Which of the following radiations photon carries the most energy

(c) visible light

(b) microwaves

(d) x-rays√

Solution:

x-rays have shortest wavelength

 $E \propto \frac{1}{1}$ 

193

By AZHAR IQBAL 0336-7098894

MDCAT PREP BOOK

**UNIT 11** 

### DAWN OF MODERN PHYSICS

Zayan Publisher

### Example:

Two photons have energies 2 eV and 4eV then the ratio between their wavelength is

(a) 1:2 (c) 1:1

(b) 2: 1√ (d) 1:4

Solution: Since  $E \propto \frac{1}{x}$ 

So ratio in wavelength will be inverse ratio of energies

### Momentum of Photon:

Momentum of photon in terms of frequency is given as	Momentum of photon in terms of wavelength is given as	Momentum of photon in terms of energy is given as	
$p = \frac{hf}{c}$	$p = \frac{h}{\lambda}$	$p = \frac{E}{c}$	
p∝f	$p \propto \frac{1}{\lambda}$	<i>p</i> ∝ <i>E</i>	
p d	p	Slope = c	

#### Number of Photons:

If a beam of light contain 'n' number of photons then total energy of the beam is given as

E = nhf

Or

Or

E = npc

Relation with frequency	Relation with wavelength	Relation between momentum
$n = \frac{E}{hf}$	$n = \frac{E\lambda}{hc}$	$n = \frac{E}{pc}$
If two beams have same $\text{Energy} \qquad n \propto \frac{1}{f}$	If two beams have same Energy $n \propto \lambda$	If two beam have same Energy $n \propto \frac{1}{p}$

- > Speed of photons in free space or vacuum is  $3 \times 10^8 ms^{-1}$
- > Speed of photons in a medium depends upon wavelength

### TROMAGNETIC WAVES SPECTRUM

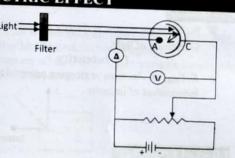

- Red has longest wavelengt' in visible region of spectrum
- · Violet has shortest wavelength in visible region of spectrum

### PHOTOELECTRIC EFFECT

"Emission of electrons from surface of Light metal when exposed to light of suitable frequency is called photo-electric effect".

> Emitted electrons are known as photo electrons and current due to photo-electrons is known as photoelectric current.

### topping Potential:

UNIT 11

- > By reversing the connections of battery (anode becomes -ve and cathode becomes +ve) electrons are reppelled by anode and photo-electric current decreases.
- > "Negative potential at anode at which photoelectric current becomes zero is called
- If V₀ is stopping potential then maximum K.E of electrons is given as

 $K.E_{max} = eV_o$ 

Example 1: If stopping potential is 0.25V then  $K.E_{max} = e(0.25V) = 0.25eV$ 

ری "e" گاری stopping potential کے کے K.  $E_{max} = \text{stopping potential}$ 

Example 2: If K.  $E_{max}$  of electrons is 0.12eV then  $V_o = \frac{0.12eV}{e} = 0.12V$ 

stopping potential = K. Emax المائدة والمائدة و

### **Information**

- > Photo-electric effect was observed by Heinrich Hertz in 1887.
- Einstein explained the photo-electric effect on the basis of photon theory in 1905.

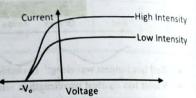

#### Note:

Inverse Phenomenon of photoelectric is x-ray production.

### Effect of Intensity:

By increasing intensity of light and keeping the frequency (or color)of light constant.

- > Photoelectric current increases.
- > K. Emax or stopping potential remains same.

### Conclusion:

> Photoelectric current is directly proportional to intensity of light.

### I & Intensity

➤ K. E_{max} of electrons or stopping potential are independent of intensity.

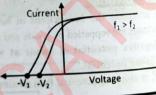

Intensity & Schange change of distance of cathode

Intensity  $\propto \frac{1}{(distance)^2}$ 

### Effect of Frequency:

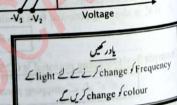

By increasing frequency of light while keeping the intensity constant.

- Photoelectric current remains same
- > K. Emax of electrons or stopping potential increases.

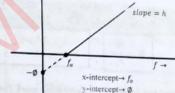

### Conclusion:

- > Photoelectric current is independent of frequency of light.
- Stopping potential increases by increasing frequency and decreases by decreasing frequency
- > K. Emax of electrons varies linearly with the frequency.

By AZHAR IQBAL 0336-7098894

- ▶ Below the threshold frequency K.E of electrons will be ve. Hence electrons will not be emitted from the metal (photoelectric effect does not occur ) however large the intensity of light may be.
- > Electrons are emitted from the metal surface(photoelectric effect does not occur) only when frequency of photon is equal or greater than threshold frequency

"Minimum frequency of light required to emit the electrons from surface of the metal is

### Cut off Wavelength: $(\lambda_c)$

Threshold Frequency (fo):

Note:

upon nature of the metal

Threshold frequency only depends

called threshold frequency."

UNIT 11

"Maximum wavelength of light required to emit the electrons from surface of the metal is called cut-off wavelength".

- Electrons are emitted from the metal surface(photoelectric effect does not occur) only when wavelength of photon is equal or less than cut off wavelength.
- > If wavelength of photon is greater than cut off wavelength ,electrons are not emitted from the metal surface (photo electric effect does not occur).

### Note:

Cut-off wavelength only depends upon nature of the metal.

$$\lambda_c = \frac{c}{f_o}$$

### Work function:(Ø)

"Minimum energy required to emit the electrons from the surface of metal is called work

### Note:

Work function only depends upon nature of the metal

- Electrons are emitted from the metal surface(photoelectric effect does not occur) only when Energy of photon is equal or greater than work function.
- If Energy of photon is less than work function , electrons are not emitted from the metal surface (photo electric effect does not occur).

	Metal	Work function (in eV)
1	Na	2.28
	Al	4.08
	Cu	4.70
	Zn	4.31
	Ag	• 4.73
	Pt	6.35
	Pb	4.14
	Fe	4.50

MDCAT PREP BOOK

197

> Relation between threshold frequency and work function is

$$\emptyset = hf_o$$

> Relation between cut-off wavelength and work function is

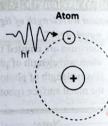

$$\emptyset = \frac{hc}{\lambda_c}$$

Short cut formula to determine work function from cut off wavelength OR cut off wavelength from work function is

$$\emptyset = \frac{1240 \times 10^{-9}}{\lambda_r} eV$$

### Einstein Explanation:

- > According to Einstein beam of light consists of stream of photons and energy of each photon is 'hf' and it only depends upon frequency.
- > According to Einstein: Intensity of light is directly proportional to number of photons.

Intensity & no. of photons

* By increasing intensity number of photons increases thus current increases.

- When a photon strikes an electron it transfers its energy to electron. Some amount of energy is used to remove the electron and rest amount of energy is given to electron as
- Einstein's photo electric effect equation is based on conservation of energy and is given as

$$hf = K.E_{max} + \emptyset$$
 OR  $K.E_{max} = hf - \emptyset$ 

$$K.E_{max} = hf - \emptyset$$

Where

$$K.E_{max} = eV_o$$
 and  $\emptyset = hf_o = \frac{hc}{\lambda_c}$ 

MDCAT PREP BOOK

- By AZHAR IQBAL 0336-7098894

- DAWN OF MODERN PHYSICS * By increasing frequency of light K.Emax increases thus stopping potential
  - $\star$  By increasing work function or threshold frequency  $K.E_{max}$  decreases thus stopping potential decreases and vice versa.

- (i). Increasing the energy or frequency of photon.
- the wavelength of (ii). Decreasing photon.
- (iii). By using a metal having larger work (iii). By using a metal having smaller function of threshold frequency.
- By using a metal having smaller cut off wavelength.

### $K.E_{max}$ and $V_o$ decreases by

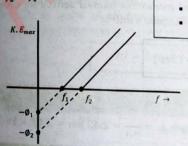

- (i). Decreasing the energy or frequency of photon.
- (ii). Increasing the wavelength of photon.
- work function of threshold frequency.
- (iv). By using a metal having larger cut off wavelength

#### For two different metals

> Slope of the graph remains same.

>	f2	>	f
			66

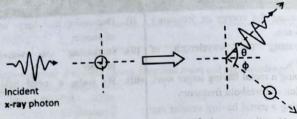

Condition	Result	
$f > f_o$ OR $E > \phi$ OR $\lambda < \lambda_c$	Photoelectric effect occur but I = 0	$K.E_{max} = 0$ $V_o = 0$
$f = f_0$ OR $E = \phi$ OR $\lambda = \lambda_c$	Photoelectric effect occur but I ≠ 0	$K.E_{max} \neq 0$
$f = f_0$ OR $E < \phi$ OR $\lambda > \lambda_c$	Photoelectric effect not occur	$K.E_{max}=0$

### COMPTON'S EFFECT

"When an x-ray photon is scattered from an electron the wavelength of scattered photon is greater that wavelength of incident photon" x-ray photon

- > When photon strikes with an electron it transfers some amount of its energy and momentum to electron that is why Scattered photon will have less energy, frequency and momentum than incident x-ray photon.( Wavelength of scattered photon is greater than incident photon )
- > Compton's effect is best evidence for particle nature of light (photon theory).
- > Change in wavelength between scattered and incident photon is called compton's shift.
- > By using law of conservation of energy and momentum formula derived for Compton's shift is and momentum formula derived for Compton's shift is

$$\Delta \lambda = \frac{h}{m.c} (1 - \cos \theta)$$

### Compton's Wavelength:

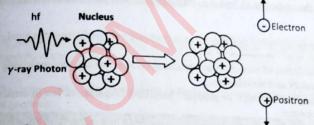

Quantity  $\frac{h}{m_o c}$  is known as Compton's wavelength  $\lambda_c = \frac{h}{m_o c} = 2.43 \ pm = 2.43 \times 10^{-12} m$ .

Scattering Angle	Compton's shift in terms of $\lambda_i$	Compton's shift in meter
00	$\Delta \lambda = 0$	$\Delta \lambda = 0$
90°	$\Delta \lambda = \frac{h}{m_o c} = \lambda_c$	$2.43 \times 10^{-12} m$
180°	$\Delta \lambda = 2 \left( \frac{h}{m_c c} \right) = 2 \lambda_c$	$4.86 \times 10^{-12} m$

 $\triangleright$  Compton's shift is maximum for  $\theta = 180^{\circ}$ 

### PAIR PRODUCTION

"When a high energy  $\gamma - ray$  photon interacts with a heavy nucleus a pair of particle and When a many nucleus a pair its anti-particle is produced this phenomenon is known as pair production".

- > In pair production a photon (energy) is converted into mass in accordance to Einstein equation  $E = mc^2$ . y + e+ + e-
- > A photon cannot create a single electron or positron alone because it will violate the law of conservation of charge.
- > Pair production cannot take place in vacuum (without interaction with nucleus) because it will violate the law of conservation of momentum. To conserve the momentum the pressure of nucleus is required.
- ▶ In order to create an electron-positron pair minimum energy  $2m_oc^2 = 1.02MeV$  is needed and surpless energy is given to electron and positron as K.E.

$$hf = 2m.c^2 + (K.E)_{e^-} + (K.E)_{e^+}$$

Minimum energy of photon required $E_{min} = 16.38 \times 10^{-14} I$	Minimum frequency of photon required	Maximum wavelength of photon required
$E_{min} = 16.38 \times 10^{-14} J$ = 1.02 MeV Example:	$f_{min} = 2.47 \times 10^{20} Hz$	$\lambda_{max} = 1.21 \times 10^{-12} m$

- Pair production can not take place in vacuum because it is against:
- (a) law of conservation of energy (b) law of conservation of charge
- (c) law of conservation of momentum
- (d) all of these

### Example:

UNIT 11

A gamma ray photon having energy 1.04 eV interacts with a heavy nucleus and an electron and positron are produced. The kinetic energy of produced electron will be:

- (a) 0.04 eV
- (c) 0.01 eV 🗸

- (b) 0.02 eV
- (d) 0.1 eV

#### Zayan Publisha

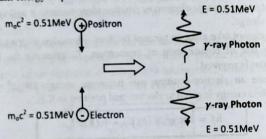

### ANNIHILATION OF MATTER

When a particle and its anti-particle combine with each other, they destroy each when a particle and two  $\gamma - ray$  photons ,this phenomenon is known as annihilation of matter."

> Mass is converted into energy in accordance to Einstein equation  $E=mc^2$ .

$$e^- + e^+ \longrightarrow \gamma + \gamma$$

- Annihilation of matter always produces two gamma ray photons having same energy frequency and wavelength.
- > Single photon cannot be produced because it is against the law of conservation of
- > Single electron or proton cannot be converted into energy because it is against the law of conservation of charge.
- Minimum energy of photon emitted is  $m_0 c^2$ .

### Note:

- > Existence of Anti-particle was predicted by Dirac in 1928.
- > Positron(Anti-particle of electron) was discovered by Anderson in 1932 from cosmic radiations

Minimum energy of photon	Minimum frequency of photon emitted	Maximum wavelength of photon emitted
$E_{min} = m_o c^2$	$f_{min} = \frac{m_o c^2}{h}$	$\lambda_{min} = \frac{h}{m_o c}$
$E_{min} = 8.19 \times 10^{-14} J$ = 0.51 MeV	$f_{min} = 1.23 \times 10^{20} \text{ Hz}$	$\lambda_{man} = 2.43 \times 10^{-12} m$

# **ATOMIC SPECTRA**

Spectroscopy:

The study of wavelength and intensity of electromagnetic radiations emitted or absorbed by atoms is called spectroscopy.

### Spectrum:

Set of all the wavelength of electromagnetic radiations emitted or absorbed by a substance is called spectrum.

ATOMIC SPECTRA

### TYPES OF SPECTRUM

### Line spectrum:

- > "Spectrum which consists of sharp lines with each line representing a specific wavelength emitted or absorbed by atoms is called line spectrum."
- Line spectrum is characteristics of emitting elements.
- > Line spectrum is due to transition of electrons between energy levels within an atom.
- > Each element has a unique set of energy levels, hence each element has a unique line
- > It is used to identify the gas or element.
- It is also known as atomic spectrum.

Line emission spectrum	Line absorption spectrum	
Line spectrum of electromagnetic radiations emitted by a substance is called emission line spectrum	Line spectrum obtained by	
Each line represents the energy or wavelength emitted by the substance	Each line represents the energy or wavelength absorbed by the substance	
Shows colored lines with a dark background		

land-spectrum:

"Spectrum which consists of group of lines so closely spaced that each group appears to be a band is called band spectrum or molecular spectrum."

For example: Nitrogen spectrum

> Band spectrum is produced when molecules radiate their rotational and vibrational energies.

### 2. Continuous-spectrum:

"Spectrum in which there is no gap or space between spectral lines is called continuous spectrum."

All the solids, liquids and very dense gases when heated produced continuous spectrum

### HYDROGEN EMISSION SPECTRUM

When hydrogen gas is placed in a discharge tube and high voltage is applied across the tube the gas starts glowing and give off bluish red light.

There were five types of series observed in emission spectrum of hydrogen atom

### Lyman Series:

- > Lyman series lies in ultraviolet region of spectrum.
- > Lyman series is produced when an electron jumps from higher energy level to 1st energy level.
- > The Rydberge formula for Lyman series is

$$\frac{1}{\lambda} = R_H \left( \frac{1}{1^2} - \frac{1}{n^2} \right)$$

Where n = 1,2,3,...

Minimum wavelength of Lyman series is produced when electron jumps from infinite to 1st shell of hydrogen atom

$$\lambda_{min} = \frac{1}{R_H} = 91 \, nm$$

Maximum wavelength of Lyman series is produced when electron jumps from 2nd to 15 shell of hydrogen atom.

$$\lambda_{max} = \frac{4}{3R_H} = 122 \, nm$$

### Balmer Series:

- > Balmer series lies in visible region of spectrum.
- Balmer series is produced when an electron jumps from higher energy level to 2nd energy level.
- > The Rydberge formula for Balmer series is

$$\frac{1}{\lambda} = R_H \left( \frac{1}{2^2} - \frac{1}{n^2} \right)$$

Where n = 2,3,4...

Maximum wavelength of Balmer series is produced when electron jumps from 3rd to 2nd shell of hydrogen atom.

$$\lambda_{min} = \frac{4}{R_H} = 365 \, nm$$

Minimum wavelength of Balmer series is produced when electron jumps from infinite to 2nd shell of hydrogen atom.

$$\lambda_{max} = \frac{4}{3R_H} = 656 \, nm$$

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

### Paschan Series:

- > Paschan series lies in infrared region of spectrum.
- Paschan series is produced when an electron jumps from higher energy level to 3rd energy level.

ATOMIC SPECTRA

> The Rydberge formula for Balmer series is

$$\frac{1}{\lambda} = R_H \left( \frac{1}{3^2} - \frac{1}{n^2} \right)$$
 Where  $n = 4,5,6 \dots$ 

Minimum wavelength of Paschan series is produced when electron jumps from infinite to 3rd shell of hydrogen atom.

$$\lambda_{min} = \frac{9}{R_H} = 820 \, nm$$

Maximum wavelength of Balmer series is produced when electron jumps from 3rd to 2nd shell of hydrogen atom.

$$\lambda_{max} = \frac{144}{7R_H} = 1874 \, nm$$

### Bracket Series:

- > Bracket series lies in infrared region of spectrum.
- > Bracket series is produced when an electron jumps from higher energy level to 4th energy level.
- > The Rydberge formula for bracket series is

$$\frac{1}{\lambda} = R_H \left( \frac{1}{4^2} - \frac{1}{n^2} \right)$$
 Where  $n = 5,6,7 \dots$ 

Minimum wavelength of Bracket series is produced when electron jumps from infinite to 4th shell of hydrogen atom.

$$\lambda_{min} = \frac{16}{R_H} = 1458 \, nm$$

Maximum wavelength of Bracket series is produced when electron jumps from 5th to 4th shell of hydrogen atom.

$$\lambda_{max} = 4050 \, nm = \frac{400}{9R_H}$$

### Pfund Series:

- > Pfund series lies in infrared region of spectrum.
- Pfund series is produced when an electron jumps from higher energy level to 5th
- > The Rydberge formula for Pfund series is

$$\frac{1}{\lambda} = R_H \left( \frac{1}{5^2} - \frac{1}{n^2} \right)$$
 Where  $n = 6,7,8 \dots$ 

Minimum wavelength of Pfund series is produced when electron jumps from infinite to 5th shell of hydrogen atom.

$$\lambda_{min} = \frac{25}{R_H} = 2278 \, nm$$

Maximum wavelength of Pfund series is produced when electron jumps from 6th to 5th shell of hydrogen atom.

$$\lambda_{max} = \frac{900}{11R_H} = 7455 \, nm$$

205

# BOHR'S MODEL

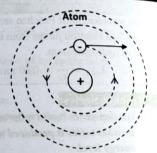

- > In order to explain emperical results obtained by Rydeberg formulated a model of hydrogen atom.
- > Bohr's model is semiclassical model based on following postulates.

According to classical physics an accelerating charge such as orbiting electron must continuously radiate electromagnetic energy.

## Postulate 1:

"Electron in an atom can move around nucleus in certain circular orbit without radiating. These orbits are called discrete stationary states of the atom."

Bohr's 1st postulate is contradiction of classical physics.

## Postulate II:

"Only those circular orbits or stationary states are allowed for which orbital angular momentum is an integral multiple of  $\frac{n}{2\pi}$ .

$$L=n\left(\frac{h}{2\pi}\right)$$

$$mvr = n\left(\frac{h}{2\pi}\right)$$

Where n is principle Quantum number and n = 1,2,3...

### Example:

What is the ratio between angular momentum of electron in 1st and 3rd shell of hydrogen atom

- (a) 1:3V
- (b) 3:1
- (c) 1:9
- (d) 9:1

### Example:

In which of the following shell the electron in hydrogen atom will highest angular momentum (d) N –shell  $(n=4)^{\checkmark}$ (c) M-shell (n=3) (b) L-shell (n=2)

## (a) K-shell (n=1)

Example: Angular momentum of electron in 3rd shell of hydrogen atom is

- (a)  $1.05 \times 10^{-34}$  J.s
- (b)  $2.10 \times 10^{-34} \text{J.s}$
- (c) 3.15 x 10⁻³⁴J.s
- (d)  $4.20 \times 10^{-34} \text{J.s}$

## Postulate III:

"When an electron jumps from high energy state E. to a low energy state Ep a photon of energy hf is emitted so that,"

$$hf = E_n - E_p$$

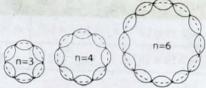

### De-Broglie's Interpretation

"According to De-Broglie electron in an orbit behave like a wave and produce stationary wave in the orbit. So length of orbit will be nh."

$$\ell = n\lambda$$

$$2\pi r = n\left(\frac{h}{mv}\right)$$

$$mvr = n\left(\frac{h}{2\pi}\right)$$

### Quantized Radii:

- > Electron can move in certain circular orbits.
- Radius of nth shell is given as

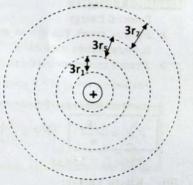

$$r_n = \frac{n^2 h^2}{4\pi^2 km e^2}$$

$$r_n \propto n^2$$

Short cut relation to find radius

$$r_n = n^2 r_1$$

where  $r_1 = 0.053 \, nm$ .

First shell	2 nd shell	3 rd shell	4 th shell	5 th shell
0.050	$r_2=4r_1$	$r_3 = 9r_1$	$r_4 = 16r_1$	$r_5 = 25r_1$
0.053 nm	0.212 nm	0.477 nm	0.848 nm	1.325 nm

As 'n' increases radius of orbit increases and distance between two consecutive orbits are also increases.

# Quantized Velocity:

Electron moving around the nucleus has discrete velocities.

> Velocity of electron in nth-shell is given as

$$v_n = \frac{2\pi k e^2}{nh} \Rightarrow v_n \propto \frac{1}{n}$$

> In moving from lower to higher shell velocity decreases

> Short-cut relation to find velocity

$$v_n = \frac{1}{n}$$
 Where  $v_1 = 2.19 \times 10^6 \text{ m/s}$ 

Example: Find the velocity of electron in 3rd shell

$$v_3 = \frac{v_1}{3} = \frac{2.19 \times 10^6}{3} m/_S = 7 \times 10^5 \, m/_S = 7 \times 10^5 \, m/_S$$

First shell	2 nd shell	, 3 rd shell	4 th shell	5 th shell
$v_1 = 2.19 \times 10^6$	$v_2 = 1.09 \times 10^6$	$v_3 = 7.3 \times 10^5$	$v_4 = 5.5 \times 10^5$	$v_5 = 4.4 \times 10^5$
$v_1 = 2.19 \times 10^6$	$v_2 = \frac{v_1}{2}$	$v_3 = \frac{v_1}{3}$	$v_4 = \frac{v_1}{4}$	$v_5 = \frac{v_1}{5}$

### Quantized Energies:

### (i). Potential Energy:

Electron posses P.E due to attraction between electron and nucleus.

> Electron moving around the nucleus

has discrete values of P.E given as:  $P.E_n = \frac{kq_1q_2}{r_n} = \frac{k(e)(-e)}{r_n} = \frac{-ke^2}{r_n}$ 

> Short relation to find P.E is

$$P.E_n = \frac{-2E_o}{n} \qquad \left(P.E \propto \frac{1}{n^2}\right)$$

Where  $E_o = 13.6 \, ev$ 

## Kinetic Energy:

- Electron posses kinetic energy due to its motion.
- Electron moving around nucleus has discrete values of K.E.

$$K.E_n = \frac{1}{2}mv_n^2 = \frac{ke^2}{2r_n}$$

## MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

Note

Orbital electrons have specific amount

of energies where as free electron can

Note

By increasing n P.E increases.

have any amount of energy

### ATOMIC SPECTRA

> Short cut relation to find K.E is

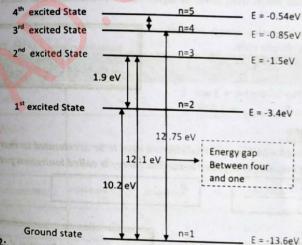

$$\boxed{K.E_n = \frac{E_o}{n^2}} \Rightarrow \boxed{K.E_n \propto \frac{1}{n^2}}$$

# (iii). Total Energy:

- T.E of electron is given as  $E_n = P \cdot E_n + K \cdot E_n = \frac{-ke^2}{r_n} + \frac{ke^2}{2r_n} = \frac{-ke^2}{2r_n} = \frac{-2\pi k^2 me^4}{n^2 k^2}$
- > Short relation to find energy of electron

$$E_n = \frac{-E_o}{n^2} \qquad \left( E_n \propto \frac{-1}{n^2} \right)$$

- > Ratio between K.E and total energy of electron is always 1: -1
- Ratio between K.E and total energy of electron is always 2:1
- Ratio between K.E and P.E energy of electron is always 1: -2

## Example 2:

P.E of electron in ground state will be.

(a) 13.6 eV

(b) -13.6 eV (c) -27.2 eV

Answer:

(d) zero eV

For ground state n = 1 and E = -13.6eVso P.E = 2(-13.6eV) = -27.2eV

Example 1: What is K.E of electron in 1st excited state.

(c) 10.2 eV

(b) 3.4 eV

Answer:

(d) 12.1 Ev

For  $1^{st}$  excited state n = 2 and E = -3.4eV so K.E = +3.4 eV

MDCAT PRI-P BOOK

## Ionization Energy:

"Energy required to remove the electron from an atom is called ionization energy."

- > It is the energy required to make the electron jump from present state to infinite State
- > Ionization energy of electron in nth shell is given as

$$E_{ionization} = \frac{+E_o}{n^2}$$

$$E_{ionization} = \frac{13.6 \, ev}{n^2} \quad \left( E_{ionization} \propto \frac{1}{n^2} \right)$$

> When an electron jumps from lower to higher orbit 'n' increases and ionization energy decreases.

Example 3: What is ionization energy of electron moving in M-shell of hydrogen atom.

- > (a) 13.6 eV
- (b) 3.4 eV
- > (c) 1.5 eV
- (d) 12.1 eV
- For M-shell n = 3 and > Answer:
- $E = -1.5 \, eV$  so  $E_{ionization} = 1.5 \, eV$

ionization Potential کے shell

ionizationری کے برابر ہو گائی remove کرویں۔

### Ionization Potential:

"Potential through which an external electron need to be accelerated so that on collision with bound electron it may supply required ionization energy is called ionization potential."

$$V_{ionization} = \frac{E_{ionization}}{e}$$

$$E_{ionization} = e V_{ionization}$$

### Example 4:

Minimum potential required to accelerate an external electron so that it may knock out the electron for 1st excited state.

(b) 3.4 V

(c) 1.5 eV

(d) 1.5 V

For 1st excited state n = 2 and E = -3.4 eV

so 
$$E_{ionization} = 3.4 \text{ eV}$$
 and  $V_{ionization} = 3.4 \text{ V}$ 

## Excitation Energy:

- > "Energy required to make the electron jump from lower state to higher energy state is called excitation energy."
- Minimum energy required to excite an atom is called excitation energy

$$E_{\text{excitation}} = E_{\text{final}} - E_{\text{initial}}$$

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

ATOMIC SPECTRA

Zavan Publishe

Energy required to excite the hydrogen atom from ground state (n = 1) to  $2^{nd}$ excited state (n = 3) is

- (a) 10.2 eV

- (d) 3.4 eV
- (c) 12.1 eV

 $E_{\rm exc} = 13.6 - 1.5 = 12.1 \, eV$ 

Answer: **Excitation Potential:** 

"Minimum potential through which an external electron need to accelerated so that on collision with bound electron it may supply the required energy is called excitation potential."

$$V_{excitation} = \frac{E_{excitation}}{e}$$

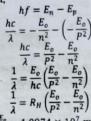

Example 6: Minimum potential required to excite the atom from ground state to first excited state is

- (a) 10.2 V
- (b) 1.5 V
- (c) 12.1 V
- (d) 3.4 V

# UNIT 13 $\rangle$

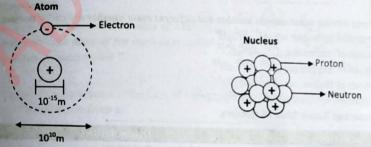

# **NUCLEAR PHYSICS**

- Rutherford discovered the nucleus and protons.
- Rutherford predicted the existence of neutrons
- Chadwick discovered the neutrons.

## Atomic Nucleus:

"At the center of each atom there is massive and positively charged nucleus containing protons and neutrons."

- About 99.9% mass of an atom is concentrated in the nucleus.
- > Size of nucleus is  $10^4 10^5$  times smaller than atom.
- > Volume of nucleus is  $10^{12} 10^{15}$  times smaller than atom.

## nified atomic mass unit:

"One twelveth of mass of carbon-12 is called unified atomic mass unit."

$$1u = \frac{\text{mass of C} - 12}{12} = 1.6606 \times 10^{-27} kg$$

Mass of proton =  $1.673 \times 10^{-27} kg = 1.007276u$ Mass of neutron =  $1.675 \times 10^{-27} kg = 1.008665u$ 

Mass of electron =  $9.1 \times 10^{-31} kg = 0.00055u$ 

# Atomic Number:

"The number of protons in a nucleus is called atomic number."

- Elements are identified by their atomic number.
- Atomic number is also known as charge number and it identify the charge of nucleus.

Charge = Ze

For Example atomic number of alpha particle is 2 so its charge will be (+2e).

AT PREP BOOF

UNIT 13

## Mass Number:

"The total number of protons and neutrons in a nucleus is called its mass number"

"The total number of problems of the nucleus for example mass number of oxygen is 16 so its mass will be 16u.

$$A = Z + N$$

## Symbol of Nucleus:

Nucleus is represented by symbol  $zX^{A}$ .

> Superscript 'A' represents the mass number of total number of nucleus in the nucleus.

> Subscript 'Z' represents the atomic number or total number of protons in the nucleus. For example symbol for uranium is ²³⁶₉₂U

No. of nucleus = 238  
No. of protons = 92  
No. of neutrons = 
$$238 - 92 = 146$$

### Isotopes:

"Atoms having same atomic number but different mass number are called isotopes."

- > Isotopes of hydrogen are 1H1, 1H2, 1H3
- > Isotopes of carbon are 6C12, 6C13, 6C14
- ➤ Isotopes of oxygen are 80¹⁶, 80¹⁷, 80¹⁸
- > Isotopes of Helium are 2He3 and 2He4
- ➤ Isotopes of Neon are 10Ne²⁰, 10Ne²¹, 10Ne²²
- > Cesium and Xenon have 36 isotopes.

-1.15	Similarities		Dissimilarities
(i).	Same atomic no.	(i).	Different mass no.
(ii).	Same no. of protons	(ii).	Different no. of neutrons
(iii).	Same no. of electrons	(iii).	Different mass
(iv).	Same chemical properties	(iv).	Different physical
(v).	Same position in periodic table	No. of the last	

## Isobars:

"Nuclei having same mass no. but different atomic no. are called isobar."

- > 1H3 and 2He3 are isobars.
- C14 and 7N14 are isobars.

## Isotones:

"Nuclei having same no. of neutrons are called isotones."

- > 6C¹³ and 7N¹⁴ are isotones.
- H³ and 2He⁴ are isotones.

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

UNIT 13

sodiphers.

Zayan Publish

"Nuclei for which the difference between neutrons and protons is same are called

NUCLEAR PHYSICS

isodiphers." Example:  $_{6}H_{7}^{3}$  (2 - 1 = 1) and  $_{6}H_{7}^{13}$  (7 - 6 = 1) are isodiphers.

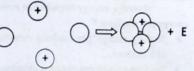

# Mass Spectrograph:

"Mass spectrograph is a device which is used to separate the isotopes and to determine their masses and abundances."

- Charged isotopes are accelerated through p.d.V they gain K.E = qV and  $V = \sqrt{\frac{2qV}{m}}$
- Then they are projected in magnetic field which exerts a deflecting force which bends in a circular path of different radii depending on their masses,  $r \propto \sqrt{m}$
- By measuring their masses by using the relation

### Mass-defect:

"The difference between total mass of nucleus and experimental mass of the nucleus is called mass defect or mass deficit."

> Loss in mass appears in the form of energy according to Einstein's Equations  $E = \Delta mc^2$ . Mass-defect is given as

$$\Delta m = Zm_p + (A - Z)m_n - m_{Nucleus}$$

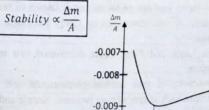

Mass-defect increases from H to U

( Somass-defect of JEll or Nucleus 17 te)

$$\Delta m = 2m_p + 2m_n - m_{He}$$

# Mass-defect per nucleon: $\left(\frac{\Delta m}{\Delta}\right)$

- Mass-defect per nucleon is also known as packing fraction.
- Mass-defect per nucleon or packing fraction measures the stability of a nucleus.

- increases from H to Fe  $\frac{\Delta m}{A}$  is maximum for 26Fe
- decreases from Fe to U

ADCAT PREP BOOF

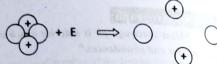

## Binding Energy.

"Energy required to break the nucleus into its constituents protons and neutrons is called binding energy."

> Energy appears in increase in mass.

> Binding energy of a nucleus is given as

$$E_B = \Delta mc^2$$

$$E_B = [Zm_p + (A - Z)m_n - m_{Nucleus}]c^2$$

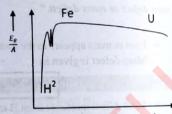

> Binding energy increases from H to U.

(جنابزا Nucleus مو كاتن زادواكل binding از قي موكا-)

## Binding Energy Per Nucleon:

"Average energy required to remove a single nucleon from the nucleus is called binding energy per nucleon."

- > Binding energy per nucleon measures the stability of a nucleus.
- > Binding energy per nucleon increases from H to Fe.
- $\triangleright$  Binding energy per nucleon is maximum for  $\frac{E_B}{}$ (26Fe⁵⁶) and its value is 8.8 Mev.
- > Binding energy per nucleon decreases from Fe to U.
- > For U²³⁸ binding energy per nucleon curve rises, products are more stable than reactants and energy is emitted (e.g. fission and fusion).

## RADIOACTIVITY

"Unstable isotopes or elements emit radioations spontaneously these elements are known as radioactive elements and this phenomenon is known as radioactivity."

- > Radioactivity was discovered by Henry Becquaral in 1896 by observing radiations from
- Marrie Curie and Piere Curie discovered two new radioactive elements radium and polonium.
- Radioactivity is pure nuclear phenomenon and it is independent of other physical conditions such as temperature pressure, electric and magnetic field etc.

By AZHAR IQBAL 0336-7098894 MDCAT PREP BOOK

## **NUCLEAR PHYSICS**

# types of radiations:

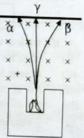

## In presence of electric field > Radiations are of three types $\alpha$ , $\beta$ and $\gamma$ .

- v-rays pass straight showing that they are neutral
- » β-rays are deflected towards +ve plate showing that they are negatively charged.
- > α-rays are less deflected showing that they are massive and B-rays are more deflected showing that they are lighter.

## In presence of magnetic field:

- > v-rays are not deflected by magnetic field because they are
- $\triangleright \alpha$  and  $\beta$  rays are deflected in opposite directions because they are oppositely charged.
- $\triangleright \alpha$  is less deflected than  $\beta$  because  $\alpha$  is massive than  $\beta$ .

Zayan Publishe

### Properties of rays:

217

# NUCLEAR TRANSMUTATION

"Conversion of parent nucleus into a daughter nucleus by emission of radiations is called nuclear transmission or nuclear decay or nuclear disintegration."

$$_{z}X^{A}(parent) \rightarrow _{z'}Y^{A'}(daughter) + radiations$$

## α-decay:

- > Alpha decay occurs with nuclei that are too large to be stable.
- > Alpha decay is caused by coulomb repulsion.
- $\triangleright$  General reaction for  $\alpha$ -decay is

$$_{z}X^{A} \rightarrow _{z-2}Y^{A-4} + He_{2}^{4}$$

- > If a nucleus emits an alpha particle its
- Mass No. decreases by 4.
- Atomic No. decreases by 2. (ii).
- No. of protons decreases by 2. (iii).
- No. of neutrons decreases by 2. (iv).
- $\frac{N}{2}$  ratio increases. (v).

## B-decay

- > Beta decay is caused by weak nuclear force.
- $\triangleright$  There are three types of  $\beta$ -decay
  - (i) ve beta  $(\beta^-)$  (ii) +ve beta  $(\beta^+)$
- $\triangleright$  General reaction for  $\beta^-$  is

$$_{z}X^{A} \rightarrow _{Z+1}Y^{A} + e_{-1}^{0} + \bar{\nu}$$

- $\triangleright$  If a nucleus emits a  $\beta^-$  particle its
- Mass No. remain same. (i).
- Atomic No. increases by one.
- No. of neutrons decreases by one.
- No. of protons increase by one

## Positive Beta decay:

 $\triangleright$  General reaction for  $\beta^+$  is

$$_{\rm Z}{\rm X}^{\rm A} \rightarrow _{{\rm Z}-1}{\rm Y}^{\rm A} + e^0_{+1} + \upsilon$$

- $\triangleright$  If a nucleus emits a  $\beta^+$  (positron) its
- (i). Mass No. remains same.
- (ii). Atomic No. decreases by one
- No. of protons decreases by one. (iii).
- (iv). No. of neutrons increases by one.

(iii) electron capture

### Note

β is due to neutron decay into a proton, electron and anti-neutrino  ${}_{0}^{1}n \rightarrow {}_{1}^{1}H + e_{-1}^{0} + \bar{v}$ 

### Note

 $\beta^+$  is due to proton decay into a neutron, positron and anti-neutrino  $\frac{1}{0}n \rightarrow \frac{1}{1}H + e_{+1}^{0} + \nu$ 

By AZHAR IQBAL 0336-7098894

# lectron capture:

For few nuclei electron usually from K-shell

is captured by nucleus

$$\mathbf{z}^{\mathsf{X}^{\mathsf{A}}} + e^{\mathsf{0}}_{-1} \to \mathbf{z}_{-1}^{\mathsf{Y}^{\mathsf{A}}} + \nu$$

- > If a nucleus captures an electron its
- Mass No. remains same.
- Atomic No. decreases by one
- No. of protons decreases by one. (iii).
- No. of neutrons increases by one (iv).

### Note

Neutrino (v) and anti-neutrino  $(\bar{v})$ have zero charge and approximately zero mass.

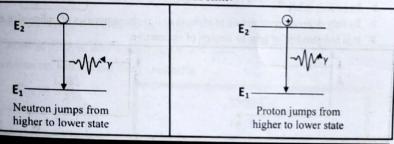

## Gamma Decay:

Gamma rays are photons just like ultraviolet and X-rays and only differs on the basis of its origin

- As there are energy levels 10.1 electrons in an atom similarly there are energy levels for nucleons in a nucleus.
- > Energy gap between nuclear levels are of order of MeV but in case of atoms energy gaps are only few electron volt.
- > When a nucleus is excited (a nucleon jumps from low energy state to higher energy state) it can decay to ground state by emission of v-ray photon.
- > General reaction for y-decay is

$$_{Z}X^{A} \rightarrow _{Z}X^{A} + \gamma$$

Mass No. and atomic No. of the nucleus remains same

## HALF LIFE

"Time in which half no. of radioactive element decay is called its half life"

# Random process:

A process without defined pattern, rule or method is called random process. Nuclear decay is random process because it is unpredictable that which atom when will decay.

# Spontaneous Process:

A process occurring without apparent external cause is called spontaneous process. Nuclear decay is spontaneous process it cannot be speeded up or slowed down by physical and chemical means.

MDCAT PREP BOOK

219

By AZHAR IQBAL 0336-7098894

MDCAT PREP BOOK

UNIT 13 Since individual disintegrations are random, however the probability of decay (half_life) in a sample has fixed value which is characteristic of that material.

- a sample has fixed value and completely decay or infinite time is required for all the atoms to decay".
- 2. Rate of decay: According to Rutherford and Soddy law for radioactive decay:
  - "Rate of decay of an element at any instant is directly proportional to number of atoms present at that instant". (ve sign - يه ظاہر كرتى ب ك atoms كى تحداد كم بورى ب-)

$$\frac{\Delta N}{\Delta t} \propto -1$$

$$\frac{\Delta N}{\Delta t} \propto -\lambda N$$

If  $N_0$  are number of atoms at t = 0 then number of atoms at any instant t are given as

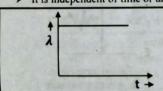

$$N=N_o e^{\lambda t}$$

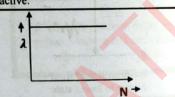

## Decay Constant ( $\lambda$ ):

"Fractional decay per second is known as decay constant or disintegration constant."

$$\lambda = \frac{\Delta N/N}{\Delta t}$$

- > Its SI unit is sec-1.
- > Its only depends upon nature of element or it is characteristics of radioactive element.
- > It is independent of time or amount of radioactive.

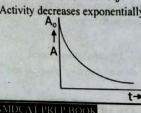

Activity: "No. of disintegrations per second is called activity or rate of decay."

 $A = \lambda N$ 

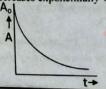

OR  $A = A_0 e^{-\lambda t}$ 

Activity decreases exponentially with time.

OR  $R = R_0 e^{-\lambda t}$ Rate of decay decreases exponentially with

 $R = \lambda N$ 

By AZHAR IQBAL 0336-7098894

AT PRI P BOOK

**NUCLEAR PHYSICS** Activity or rate of decay depends upon time, No. of atoms and nature of radioactive element. SI unit of activity is Becquaral: 1 Bq = one disintegration per sec

- > A common unit of activity is curie:  $1Ci = 3.7 \times 10^{10} Bq = 3.7 \times 10^{10}$  disintegration per sec

## Half life:

- > Half life of a radioactive element only depends upon nature of element and independent of time and no. of atoms.
- After each half life no. of atoms will become half of its initial value.

No of half lives	1	2	3	4	5
	$\frac{1}{2}$	$\frac{1}{4}$	1 8	$\frac{1}{16}$	1 32
	$\frac{1}{2}$	3 4	$\frac{7}{8}$	15 16	31 32

(اوروالے table کیدرے اگر half-life کی تعداد دی ہو ق fraction مطوم ر سكت بين بااكر fraction دى مو تو half-life كي تعد اد معلوم كر سكت بين

### Note

One curie is approximately equal to activity of one gram of radium.

If 't' is total time for 'n' half lives then

$$t = nT_{1/2}$$

- No. of atoms of undecayed after nth half life:  $N = \frac{N_o}{2^n}$
- No. of atoms of decayed after nth half life:  $N = \frac{(2^n 1)N_0}{2^n}$
- > Relation between half life and decay constant is

$$T_{1/2} = \frac{l_n(2)}{\lambda}$$

$$T_{1/2} = \frac{0.0693}{\lambda}$$

 $T_{1/2}=rac{1}{\lambda}$  اگر دونوں شی سے کوئی ایک معلوم ہو تو اس فار مولے ہے دوسری کو معلوم کریں۔

## Mean life:

Time in which 63% of a radioactive element is decayed is known as mean life.

mean life =  $T^* = \frac{1}{1}$ 

- $T^* = \frac{T_{1/2}}{0.693} = 1.44 \, T_{1/2}$
- Mean life is about 44% more than half life.

## RADIATION EXPOSURE

## Back ground radiations:

- > "Radiations present in the environment whose source unknown is are called back ground radiations."
- Background radiations varies from place to place.
- > Source of background radiation are
  - Cosmic radiations
  - · Radioactive substance in earth's crest.
  - Building materials containing small amount of radioactive substance.
  - · Radioactive radon gas enters buildings from ground.
  - · All types of food contain small amount of radioactive substance common are potassium-40 and carbon-14 isotopes.
  - Radiations added in environment by human activities such as medical practices diagnostic x-rays.
  - · Other sources include radioactive waste from nuclear facilities, hospitals and research centers, colour T.V, luminous watches and tobacco leaves

## osmic Radiations:

"Radiations coming from outer space to earth in form of high energy electromagnetic radiations and charged particles are called cosmic rays."

- > Atmosphere acts as a shield to absorb some of these radiations.
- > Ozone layer absorb ultraviolet radiations which causes eye and skin diseases.
- Recently a depletion in ozone layer was observed due to a chemical chloro-floro carbon which is used in aerosol sprays, refrigeration, paints and foam industry.

# BIOLOGICAL EFFECTS OF RADIATIONS

## Absorbed dose:

"The energy E absorbed from ionzining radiation per unit mass m of the of absorbing body is called absorbed dose."

By AZHAR IQBAL 0336-7098894

### NUCLEAR PHYSICS

is SI unit is gray  $(1Gy = 1Jkg^{-1})$ .

Its old unit is "rad" (radiation absorbed dose)

 $1 \, rad = 0.01 \, Gy \, or \, 1 \, Gy = 100 \, rad$ 

Equal dose of different radiations don't produce same biological effect

Biological effect depends upon two factors

- 1. Types of radiation
- 2. The part of body absorbing radiation.
- Neutrons are more damaging to eyes than other parts of body.
- For same absorbed dose α-rays are 20 times more damaging than x-rays.

## Equivalent Dose:

"The product of absorbed dose and RBE (relative biological effectiveness) of the kind of radiation being absorbed is called equivalent dose."

$$D_e = D \times RBE$$

- It's SI unit is sievert (Sv):  $1Sv = 1 Gv \times RBE$
- > It's old unit is "rem" (Rontgen equivalent mass)

$$1 rem = 0.01 Sv$$
 or  $1 Sv = 100 rem$ 

- > Background radiation to which we expose on average is 2mSv per year.
- > Doses of 3Sv will cause radiation burn to the skin weekly dose of 1mSv is consider to be safe for the workers of nuclear facilities or mines

Dosage in microsiervert	Effect	Dosage in microsievert	Effect
1×10 ⁶	Radiation sickness	$2.5 \times 10^{6}$	Sterility for about two years
1.5 × 10 ⁶	Temporary low fertility	4 × 10 ⁶	Death of 60% of people exposed

- $\triangleright$  The damage from  $\alpha$ -particle is small until it enters the body.
- $\alpha$  and  $\beta$  particles cause redness and sores on the skin.

Low level radiation effects	High level radiation effect
<ul> <li>Loss of hair</li> <li>Ulceration</li> <li>Stiffening of lungs</li> <li>Drop in white blood cells which results in sickness pattern of diarrhea, vomiting and fever known as radiation sickness.</li> </ul>	<ul> <li>Disrupt blood cells seriously lead to anemia and leukemia</li> <li>Chromosome abnormalities or mutation may cause delayed genetic effects such as cancer and eye cataracts and abnormalities in future generation.</li> </ul>

UNIT 13

# BIOLOGICAL AND MEDICAL USES OF RADIATIONS

- > Radioisotopes are used to find out what happens in many complex chemical reactions and how they proceed.
- how they proceed.

  In biological, they have helped in investigating into chemical reactions that take place in plants and animals.
- Radio active isotopes are used to determine proper amount of fertilizer taken up by plant.
- Radio active isotopes are constructed by plant.
   Radiation induced mutation improved varieties of crops. Such as rice, chickpea, wheat and

## Radio active Tracer:

"Tracer technique is to substitute radioactive atoms for stable atoms of same kind and then follow the radioactive atoms with the help of radiation detector. These radioactive elements are known as radioactive tracers."

- > In medicine, tracers are used to detect malignant tumors.
- > In agriculture, tracers are used to study the uptake of a fertilizer.
- > Tracers are used to identify faults in underground pipes.

Radioactive Element	Isotope	Use in medicine
Iodine	I-131	Mostly absorbed in thyroid gland  : Hyper active gland absorb more than twice amount of iodine than normal gland  • Used for treatment of thyroid gland cancer
Phosphorous	P-32	Mostly absorbed by bones used for treatment of skin cancer.
Cobalt	Co-60	Mostly absorbed by liver used for treatment of cancer.
Sodium	Na-24	It is uniformly disturbed throughout the body and used to study the circulation of blood.
Strontium	Sr-90	Used for treatment of skin cancer.

The γ-rays radiograph is used in medical diagnosis such as internal imaging of brain and determine precisely the size and location of tumors.

## BASIC FORCES OF RADIATIONS

- Basic forces of nature are:
  - 1. Gravitational force
  - 2. Magnetic force
  - 3. Electric force
  - 4. Weak nuclear force
  - 5. Strong nuclear force

By AZHAR IQBAL 0336-7098894

> Electric and magnetic forces were united to get an electro magnetic force by Faraday and

**NUCLEAR PHYSICS** 

- In 1979, Glashow Weinberg and Abdus Salam shared Nobel prize for the unification of electromagnetic and weak force (electroweak force).
- It is expected that strong nuclear force will unite with electro weak force resulting in grand unified electroweak force.

Force	Nature	Range	Carrier particles	Relative strength	Effect
Gravitational	Attractive	Long range infinite (obey inverse square law)	Gravitone (not yet discover)	10-38	Binds the masses with each other such as stars and galaxies Responsible for binding the satellite, atmosphere and set with the earth
Weak nuclear	Repulsive	Short range (~10 ⁻¹⁷ m)	W+, W-, Z· (Bosons)	10-13	<ul> <li>Responsible for spontaneous breaking up of radioactive element.</li> <li>Responsible for β⁺and β⁻decay</li> </ul>
Electro magnetic	Attractive or repulsive	Long range or infinite (obey inverse square law)	Photons	10 ⁻²	<ul> <li>Binds together atoms, molecules, crystal, trees</li> <li>Responsible for various macroscopic forces such as friction, adhesion, cohesion etc.</li> </ul>
Strong nuclear	Attractive	Short range (~10 ⁻¹⁵ m)	Gluons	ons and by comic port os ed esist nomic por Baryons	<ul> <li>Effective only within subnuclear distances.</li> <li>Binds the neutrons and protons within the nucleus.</li> <li>Responsible for binding planets with the sun.</li> </ul>

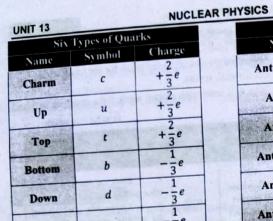

## Quarks:

- All photons quarks leptons are elementary particles.
- Hadrons are not elementary particles but are composed of quarks.

wies which don't experience strong nucleur h

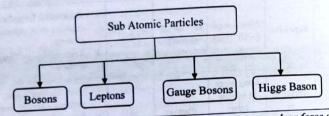

- According to quark theory by M. Gell Mann and G. Zweig the quarks are basic building block of mesons and baryons.
- It is proposed that there are six quarks
  - 2. Down 3. Strange
    - 5. Bottom 6. Top

Projectile motion has acceleration at each point of trajectory: (a) Variable (b) Constant (c) Zero projectile motion of object on earth is always (d) None of these (a) Linear (b) Parabolic (c) Circular (d) None of these Average speed of a object after a completing a circle of 5m radius in 5 seconds: (c) Zero (a)  $2\pi$ (d) 10m Average velocity is defined as (a) Displacement/time (b) Distance/time (c) Distance × time (d) Displacement x time A ball is fired horizontally from the top of a cliff with sped of 30ms-1. What will be its speed after four seconds. (b) 40ms (a) 30ms (c) 50ms Kinetic energy of a projectile is minimum at a point where velocity and acceleration are (a) Parallel (b) Anti-parallel (c) Perpendicular If a ball thrown with velocity v reaches to maximum height 'h'-then the ball having half mass and thrown with double velocity will reach maximum height (b) 2h If a car is moving with increasing velocity then the angle between its velocity and acceleration is: (b) 45° (c) 90° 9. If a lighter and heavier ball are moving with same momentum then (a) Lighter ball is moving faster (b) Heavier ball is moving faster (c) Both are moving with same speed (d) They can never have same momentum 10. A projectile is thrown at an angle  $\theta$ , during its motion the angle between velocity vector and acceleration: (a) Increase (b) Decrease (c) Remains same (d) Unpredictable 11. If a projectile is projected at an angle 60° then which of the following relation b/w range and height is true. (a) R > H (b) R < H (c) R = H (d)  $R = \sqrt{3}$ 12. At the highest point of trajectory of a projectile which of the following quantities is zero: (a) Horizontal velocity (b) Total velocity (c) Vertical velocity (d) None of these 13. If the velocity of an object is increasing with time then acceleration is (a) Negative (b) Positive (c) Zero (d) None of these 14. An object moves 20 m in 5 sec. What is the gradient of the displacement-time graph? (b) 15 (c) 4 (d) 1/4 15. An object is moving at constant speed, which of the following is always true: (a) Distance is greater than displacement (b) Distance is lesser than displacement (c) Distance is equal to displacement 16. The displacement has .... (d) We cannot answer (a) Magnitude only (b) Direction only (c) Magnitude and direction 17. If momentum of a freely falling body is changing at a constant rate 50 kgms⁻² then mass of the (a) 5kg (b) 25kg (c) 50kg (d) 500kg ADCAT PREP BOOF By AZHAR IQBAL 0336-7098894

28. In the above question acceleration produced in 1kg body is Zavan Publisher (c) 20ms⁻² (a) ones (d)  $0.5 \text{ms}^{-2}$ 29. A 250m long train is moving with a uniform speed of  $72kmh^{-1}$ . The time taken by the train to cross a bridge of length 750m is (b) 25 sec (c) 375 sec (d) 37.5 sec (a) 37.5 sec (d) 37.5 sec (a) 30. A 1 kg ball moving with speed 10m/s collides with a wall and rebounds with same speed. If time of impact is  $\frac{1}{10}$  sec then force exerted on the wall is: (d) 2000N 31. If a projectile reaches 100m height and 100m far from its initial point it strikes the ground then its angle of projection will be (d) 76° 32. At maximum height velocity of projectile is equal to (b) Horizontal component of velocity (c) Vertical component of velocity (d) Initial velocity 33. The expression for height of projectile is  $v_i^2 \sin^2 \theta$  $v_i^2 \sin^2 \theta$ 34. If force-time graph of a body is shown in the figure below then change in momentum of body will (b) 0.2N.s c 0.3N.s 35. A particle of mass m moving with a velocity strikes a wall and rebounds back. If the magnitude of the velocity is unchanged, the magnitude of force exerted on the wall by the particle during time of contact (t) will be: (a) Zero (b) 2mv/t (c) Mvt 36. The displacement-time graph of two bodies A and B are shown in fig. The ratio of  $V_A/V_B$  is: Displacement-time (a) √3 (b) 1/√3 37. For projectile motion in the absence of air resistance: (a) Vertical speed is constant (b) K.E is constant Horizontal acceleration is zero Vertical acceleration is zero AT PRI-P BOO By AZHAR IQBAL 0336-7098894

FORCE AND MOTION

38. Acceleration of particle is not zero if:

(a) Direction of velocity changes

(b) Magnitude of velocity changes

(d) All

(c) Speed changes
39. If v-t graph for three moving bodies A,B,C is shown in the figure below than distance covered in large for All have same

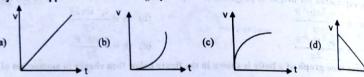

(a) A

40. The resultant of two displacement 10m and 4m may be

(b) 4m

41. An object is dropped from rest. Its v-t graph is

42. If two bodies of masses 1kg and 2kg are projected at angles of 30° and 60° respectively then the ratio between their maximum height will be:

(a) 1:1

(c) 3:1

43. When a 4kg bomb at rest explodes into two pieces of masses 1kg and 3kg moving in opposite direction. Then the ratio between linear momentum of the pieces is:

(b) 1:3

(c) 3:1

44. A force of 10N acts on stationary mass of 2kg for 5 s. then the gain in velocity is:

(a) 5 ms⁻¹

(b) 10 ms⁻¹

(c) 15 ms⁻¹

(d) 25 ms

45. Slope of velocity time graph gives the

(a) Displacement

(b) Speed

(c) Acceleration

(d) Velocity

46. If a body is falling freely then the distance covered by body in two second and 3rd second are (a) 20,30 (b) 20,25 (c) 20,45 (d) 25,45

47. For a moving body which of the following quantity can never by zero

(b) Displacement (c) Average velocity (d) Acceleration (a) Distance 48. If A is amplitude of pendulum then distance and displacement covered by simple pendulum in one vibration are:

(a) 0.0

(d) 0,4a (b) 4A,4A 49. The displacement time graph for two bodies A and B are straight lines inclined at 60° and 30° to (c) 4A,0 time axis. The ratio of their speeds is:

(a) 3:1

(b) 1:√3

(d) 1:3

50. A train has a speed of 60km/h for first one hour and 40km/h for the next half hour then its average speed is:

(a) 53km/h

(b) 80km/h

(c) 120km/h

(d) 180km/h

## PRACTICE TEST NO. 3

The ratio of displacement to distance covered by a body is always:

(a) Less than one

(b) Equal to one

(c) Greater than one

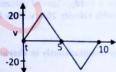

(d) Both a and b

2. The ratio of distance to magnitude of displacement for a semi-circle of radius r is: (b) π

(c)  $\pi/2$ 

3. If body covers first half displacement with velocity v₁ and second half displacement with velocity v2 then its average velocity is

Find the total distance and displacement covered from the following v-t graph:

(a) 0.0

100,100

(c) 200,200

(d) 100.0

5. Time rate of change of momentum of a body is equal to:

(a) Acceleration

(b) Force

(c) Torquel

(d) Power

6. Two blocks of masses 1kg and 3kg placed in contact are acted upon by a force of 40N. the acceleration of 1kg mass will be: (a) 4 ms⁻² (b) 10ms⁻²

(c) 30ms⁻²

(d) 50ms⁻²

7. A person standing in a boat throws a heavy stone in forward direction the boat moves in backward direction according to Newton's: (b) 2nd Law

(a) 1st Law

(c) 3rd Law

8. If the velocity time graph of a body is parallel to time axis then body is moving with (a) Uniform velocity

(b) Uniform acceleration

(c) Non uniform acceleration

(d) Both a and b

9. In case of elastic collision which of the quantity is conserved:

(c) Total energy (d) All of these

10. If 1kg body is projected at an angle 30° with the horizontal, with an initial velocity 20ms⁻¹. Then maximum height reached by the body is:

(a) 1m (b) 5m

(a) Kinetic energy (b) Momentum

(c) 10m (d) 0.5m 11. Trajectory of a projectile is shown in the figure below. Then what is its time of flight and horizontal range? (a) 4s, 120m (b) 8s,220m

12. An airplane flies 400m north, then 200m South then its resultant displacement is:

(b) 300m

(d) 16s,420m

13. If two bodies of masses 2kg and 4kg are subjected to same force then the ratio between the acceleration produced in the bodies is: (a) 1:2 (b) 2:1 (c) 1:4 (d) 1:1

14. If slope of velocity time graph is not constant at different points then body is moving with: (a) Constant acceleration (c) Variable acceleration Average acceleration (d) Uniform velocity 10. 11.

Secretarion will be:	FORCE AND MOTION	FORCE AND MOTION

16.	If two bodies are projected with same sp	eed at	angle o	of 30°	and 60°	then the ratio	between their
	time of flight will be:				e of near		restrict the trick

(b) 1:√3

 $\sqrt{3}:1$ (c)

17. If velocity of projectile at maximum height is 50% of its initial velocity then the angle of projection is: (b) 45° (c) 60°

(a) 30°

18. When we jump out of a boat standing in water, it moves:

(a) Backward

(b) Sideways

(c) Forward

(d) None of these

19. A moving body will have impulse if it is moving with

(a) Variable velocity

(b) Constant acceleration

(c) Variable acceleration

(d) All of these

20. If two bodies of unequal masses collide with each her then which of the following statement is not

(a) Both are subjected to same force

(b) Both are subjected to same impulse

(c) Momentum of both balls changes equally

(d) None of these

21. A 1200kg car has its velocity reduced from 20ms⁻¹-1 to 15ms⁻¹ in 3 se(c) the retarding force on the car is

(b) 200N

(c) 2000N

(d) 20000N

22. The time rate of change of momentum of a body falling freely under the action of gravity is equal to its.

(a) Kinetic energy

(b) Impulse

(c) Weight

(d) Acceleration

23. The velocity of a car which is decelerating uniformly changes from 30ms⁻¹ to 15ms⁻¹ in 75m. After what further distance will it come to rest?

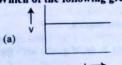

(c) 75m

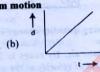

(b) 50m 24. If 10N fore causes a change in momentum of the body 0.5kgms-1 then time of impact of force is

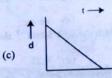

(a) 5 sec

20 sec

25. Which of the following graph represents the uniform motion

All of these

26. A bomb of mass 200g is thrown in vertically upward direction and it' explodes at the top of its path into two pieces. If one piece of mass 50g moves with velocity 15m/s then velocity of 2nd piece will be

b

Ans:

(c) 30ms⁻¹

(d) 45ms⁻¹

27. A ball is projected at 45°. If its horizontal range is 40m then its velocity of projection will be (c) 20ms⁻¹ (b) 10ms (a) 5ms⁻¹ 26. 25. 22. 23. 21. 20. 19. 16. d d d

By AZHAR IQBAL 0336-7098894

28. Force required to accelerate a 2kg body from velocity 5ms⁻¹ to 10ms⁻¹ in 20 sec is (a) 0.1 N

**FORCE AND MOTION** 

(d) 1.5N

(a) 0.115N

(b) 1.5N

(c) 1.5N

(d) 1.5N

(e) 1.5N

(e) 1.5N

(e) 1.5N

(force required to stop another car in same time, moving with double momentum will be: (b) 2F (c) F/2

(a) (d) 4F

30. If X is distance covered by a freely falling body in two seconds and Y is distance covered in 3rd second then the relation between X and Y will be (a)  $\chi = 5Y$  (b)  $\chi = \frac{\gamma}{2}$ 

(c) X = Y - 5

(d) X = Y + 5

31. Force required to accelerate an object of mass 2kg from rest to a velocity 10ms in 5 sec is (b) 4N (c) 8N

32. Mass M₁ has a velocity of 0 m/s and mass M₂ has a velocity of 5 m/s. Mass M₁ > M₂. Which one

has larger inertia?

(b) M₁

(c) Both M1 and M2 (d) Not enough information 33. Two blocks of masses 1kg and 4kg are placed in centact and are acted upon by a force of 50N then the force on 4kg body is

(a) 10N

(b) 40 N

(c) 50N

(d) 200 N

34. Rate of change in displacement is known as:

(b) Velocity

(c) Acceleration

(d) Momentum

(a) Speed 35. If a projectile is launched with 3m/s velocity at 60 degree angle then at highest point its horizontal velocity is

(a) 3 m/s

(b) 2 m/s

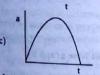

(c) 1.5 m/s

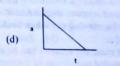

(d) 1.8 m/s

36. If A body falls under the action of gravity then the graph between its acceleration and time will

37. Velocity of an object changes from 20 m/s to 50 m/s in 5 sec. What is the acceleration of the

(a) 6 m/s

(b)  $6 \text{ m/s}^2$ 

38. If a heavy ball of 5kg moving with velocity 10ms⁻¹ collides with a stationary ball of mass 10g. Considering elastic collision the velocity of lighter ball after the collision will be (a) Zero

39. Two balls of masses m₁ and m₂ moving in same straight line undergo an elastic collision then transfer of energy will be minimum

(a)  $m_1 = m_2$ 40. If three balls of masses 1kg, 2kg and 3kg are moving with velocities  $20 \text{ms}^{-1}$ ,  $15 \text{ms}^{-1}$  and  $5 \text{ms}^{-1}$ 

respectively then it will be more harder to stop (a) | kg ball (b) 2kg ball (d) None of thes (c) 3kg ball 29. 31. 32. 38. 39. 35. 36. 37.

IDCAT PREP BOOK

41. If a shell explodes in air and its fragments	fly off in different directions.	Then total momentum
fragments is		mentum 0

(a) Zero

(b) Less than initial momentum

(c) Greater than initial momentum

(d) Equal to initial momentum

42. If a 2kg ball moving with velocity 2ms⁻¹ strikes the wall and rebounds back with same velocity then impulse acting on the ball will be

(a) Zero

(b) 2 N.s

(c) 4 N.s

(d) 8 Ns

43. If a ball projected vertically upward reaches the ground in 10 sec with velocity 49ms⁻¹ then acceleration of the ball is.

(a) 4.9ms⁻²

(b) 9.8ms⁻²

(c) -4.9ms⁻²

(d) -9.8ms⁻²

44. Consider a car is travelling for one hour. In which of the following cases the average velocity is zero?

Car travels 20 km due east

Car travels 60 km due east, then turns around and travels 40 km due west

(c) Car travels 70 km due east

(d) Car travels 30 km due west, then turns around and travels 30 km due east

45. Decrease in velocity per unit time is called

(a) Acceleration

(b) Retardation

(c) Positivity acceleration

(d) Uniform acceleration

46. A body falls freely under the action of gravity. How much distance it falls during an interval between 2nd and 3rd second of its motion.

(a) 5m

(b) 10m

(c) 25m

(d) 45m

47. When a particle is launched at angle of 90 degree with respect to horizontal then vertical acceleration is

(a)  $-9.8 \text{ m/s}^2$ 

(b)  $9.8 \text{ m/s}^2$ 

(c) 0

(d)  $5 \text{ m/s}^2$ 

48. When an object moves in a straight line then

(a) Its displacement is equal to distance

(b) Its displacement is greater than distance

(c) Its displacement is less than distance

(d) We cannot measure displacement

49. Acceleration of a moving car when brakes are applied is

(a) Negative

(b) Zero

(c) Positive

(d) Infinite

50. A motion with constant velocity can be represented on displacement time graph by:

(a) A horizontal line

(b) A curve line with decreasing gradient

(c) A straight line with constant gradient

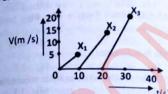

(d) A curve line with increasing gradient

## PRACTICE TEST NO. 5

FORCE AND MOTION

The X1, X2 and X3 are distance travelled by the three different particles whose velocity-time graph are shown below then

(a)  $x_1 > x_2 > x_3$ 

(b)  $x_1 = x_2 > x_3$ 

(c)  $x_1 = x_2 = x_3$ 

(d)  $x_1 < x_2 < x_3$ 

2. An athlete completes one round of a circular track of radius 10m in 40 seconds what will be its average velocity

(a) 0.5 ms⁻¹

(b)  $\pi/4 \text{ ms}^{-1}$ 

(c)  $\pi/2ms^{-1}$ 

3. If a body is thrown vertically upward, it moves upward with acceleration 'x' and moves downward with acceleration 'y' then the angle between 'x' and 'y' is: (a) 0° (b) 45°

4. How far does a car travel in 6 s if its initial velocity is 2 m/s and its acceleration is 2 m/s2 in the (a) 12 m (b) 14 m

(c) 24 m

(d) 48 m

5. The ratio of unit of impulse to unit of momentum is: (a) kg (b) m

(c) s-1

6. In case of projectile motion which of the following quantity is conserved (remain constant): (b) Velocity 7. When body is projected at an angle of 30° then which of the following always remains zero; (c) Acceleration

(d) Kinetic energy

(a) Vertical velocity (c) Vertical acceleration

(b) Horizontal velocity

8. A body of mass m is projected at an angle heta with initial velocity v then maximum height reached (d) Horizontal acceleration

(a) Mass

(b) Angle of projection (c) Initial velocity 9. If body is projected with initial velocity  $10ms^{-1}$  it reaches to maximum height of 40m. What will be maximum height if body is projected with initial velocity of 20ms⁻¹ at the same angle of

(a) 20m

(d) 160m

10. At which angle of projection the horizontal range will be maximum

11. If the ratio between time of flight of two projectiles is 1:2 then the ratio between their maximum (a) 1:2 (b) 2:1 12. Quantitative measure of inertia of the body is its:

(b) Volume

(c) 1:4

(c) Energy (d) Momentum

**WORK AND ENERGY** Zayan Publisher UNIT 02  $\rangle$ **WORK AND ENERGY** PRACTICE TEST NO. 1 Work done on a body is negative. If the angle between force and displacement is: (a) Less than 90 (b) Equal to 90 (c) Greater than 90 (d) Zero (a) Less many (d) Zero

If force-displacement graph for a moving car on a straight road is shown in figure below then its change in K.E will be 50 5 d 10 (b) 200J (c) 5001 (d) 1000J 1 The ratio of unit of power to unit of work is the unit of: (a) Mass (b) Length (c) Time 4. If a pump lift 100m³ water from ground to a height of 10m in 5min then its power will be? (d) Frequency (b) 50KW (c) 33KW 5. If reference point is choosen at infinity the gravitational P.E of a body on the surface of earth given as (d) all 6. If a body moving with the velocity 4m/s has K.E 16J. What will be its K.E if it is moving with (a) 2J (b) 5J (c) 9J 7. A satellite is moving in a circular path with uniform speed then work done on the satellite is: (b) Negative (c) Positive and maximum & A body falls from a tower. After falling a distance d the velocity of the body will be? (b)  $\sqrt{gd/2}$ 9. A body falls freely under gravity, its velocity is v when it has lost a P.E of U. Then the mass of 10. In the presence of air friction the relation for falling body is: (c) U/2v (b)  $mgh = \frac{1}{2}mv^2 + fh$ (c)  $mgh=fh-\frac{1}{2}mv^2$ II. ln an explosion a bomb breaks up into two pieces of unequal masses. In this case: (a) Lighter part will have more momentum (b) Heavier will have more momentum (c) Both parts will have equal K.E. Mork done is 2. A body moves a distance of 10m along a straight line under the action of a force of 5N. If the work done is 25J, the angle which the force makes with the direction of motion of body is:

(a)  $0^{\circ}$  (d)  $60^{\circ}$ 

50

10. 11. 12.

By AZHAR IQBAL 0336-7098894.

b

13. A light and heavy body have equal momentum. Which one has greater K.E?

(a) Heavy body

(b) Light body

(c) K.E are equal

Data is (d) incomplete

14. A light and heavy body have equal K.E, Which one has a greater momentum?

(a) Light body (b) Heavy body (c) Bothe have equal momentum

(d) It is not possible to say anything without additional information

15. The consumption of energy by 60 watt bulb in 2s is:

(b) 10J

(c) 30J

(d) 1201

16. The engine of the car applies the force of 2000 N by which it moves with a uniform velocity of 72km/h. The power delivered by engine is:

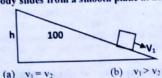

(a) 2kW

(b) 144kW

(c) 44kW

(d) 40kW

17. A body slides from a smooth plane at height h as shown figure below then:

(c)  $v_1 < v_2$ 

(d)  $v_1 = v_2 = 0$ 

18. Which among the following is a form of energy:

(a) Light

(b) Momentum

(c) Power

(d) Pressure

19. A man does a given amount of work in 10s. Another man does the same amount of work in 20s. The ratio of the output power of first man to second man is:

(b) 2/1

(c) ½ (d) None of these

20. Dimensions of power are

(a) ML2T-3

(b) ML²T⁻²

(c) MLT

(d) MLT-2

21. In which of the following case work done is zero

(a) Work done by a man pulling a cart on smooth surface

(b) Work done by engine accelerating the car

Work done in pushing a rigid wall

(d) Work done by gravity on a falling body 22. If a body of mass 2kg is raised to a height of 5m then work done by gravity will be

(a) 10J

(b) 100J

(c) -100J

23. Type of energies possessed by moving car and stretched spring are respectively

(a) P.E and K.E

(b) K.E and P.E

(c) K.E and K.E

(d) P.E and P.E

24. Work done by gravity on a simple pendulum in one vibration is

(a) Zero

(b) Positive

(d) Depends upon initial position

25. If a block of mass 20kg is pushed along the surface of a inclined plane upto a height of 20m from the ground then T.E possessed by block at the top of the plane will be

(c) 6000J

26. If electron, proton, neutron and alpha particle are moving with same K.E then which one is

moving faster (a) Electron

(b) Proton

(c) Neutron

d

WORK AND ENERGY

Zavan Publisher

 $27.11 \vec{F}$  is force required to sustain the motion of a car with velocity  $\vec{v}$  then power of the engine will

(d) Zero

28. At which of the following angle between force and displacement the work done will be negative 29. If velocity of a body of mass 10kg is increased from 5ms⁻¹ to 10ms⁻¹ then work done on the body is

(d) 920J

30. A 70 kg man run upstairs in 10sec If vertical height of stairs is 8m then his power will be about (d) 34KW

11. If force-displacement graph for a body is shown in the figure below then the change in energy of the body will be

(b) 400J (a) 200J

(c) 500J

32. If a 1KW mater pulls a load by a distance 20m in 40sec then force exerted by the motor is (b) 2000N (c) 4000N (d) 5000N

33 A brick of mass 2.5kg falls from height 6m above the ground After covering a distance 2m its K.E.

(d) 150J

34. Work done in staking ten bricks one on the top of another if mass of each bricks is 'm' and thickness is 'h'

(a) mgh

(b) 10mgh

(b) 50J

(c) 25mgh

(c) 100J

35. Change in kinetic energy of a car with time is shown in figure below. Ignoring frictional forces what is power of the engine?

(a) 200W

(b) 400W

(c) 16x104W

(d) zero

36. When a spring is stretched, work done by stretching force is (a) Positive

(b) Negative (c) Zero (d) None of these 37. Man moves a roller through a distance of 20 m. 10N of applied force is inclined of 60° of direction of motion what will be the work done by the man.

(a) 100 J

(b) 50J

(c) -100J

(d) -50J

(a) Torque (c) Power

(b) Momentum

(d) Angular momentum

39. KE of body is increased by 44%, What is the percentage increase in the momentum

(b) 20%

(c) 30%

40. Work done by a conservation force in a complete cycle is:

(a) Zero

(b) More than zero (c) Less than zero (d) None of these

41. Work is done on a body if: (a) Its energy increases

(b) Its energy decreases

(c) It covers displacement in direction of force (d) All of these

42. When two electrons are brought closer to each other then their P.E:

(a) Increase

(b) Decrease

(c) Remain same

(d) May increase or decrease

43. A stationary particle explodes into two particles of masses m₁ and m₂ which moves in opposite directions with velocities v1 and v2. The ratio of their K.E: (b)  $m_1 v_1 / m_2 v_2$ (c)  $m_1/m_2$ 

weighs 20g the power of gun is:

44. From an automatic gun a man fires 360 bullet per minute with a speed of 360 km/h. If each

(d) 150W

(a) 600 W (b) 300 W 45. It is easier to push or pull an object when force is

(a) Parallel to displacement

(b) Perpendicular to displacement

(c) Anti-parallel to displacement

(d) Both a and c

46. If a 100kg car is accelerated from rest to a velocity 10ms-1 then work done by engine will be

(a) 1KJ

(b) 0.5KJ (c) 5KJ

47. If K.E of a body having velocity v and momentum P is X then K.E of th body having velocity '2v' and momentum 2p will be

(a) X

(b) 2X (c) 4X

48. The K.E of a body of mass 2kg and momentum of 2Ns is:

(b) 3J

(c) 2J

49. A variable force F = x is applied what will be the work done in moving the particle from x = 0 to 1:

(a) 2 J

(b) 1 J

(c) 0.5 J

(d) 5 J

50. A body of mass 10 kg moving at a height of 2m, with uniform speed of 2 m/s has total energy.

(b) 216 J

(c) 392 J

## UNIT 02 PRACTICE TEST NO. 2

WORK AND ENERGY

An object is displaced from point A(0,0,1)m to point B(1,4,3)m under a constant force F = (l + 2l + 3k), find the work done by this force in this process (b) 15 J

(c) 0

Two forces of 5N and 15N are working on a body in opposite direction. If body displaced by 5m in direction of net force, what will be the work done by net force: (b) -50 J (c) 25 J

An object of mass 'm' is projected vertically upward with initial velocity v then the maximum height reached by object is directly proportional to

Two bodies of masses 2kg and 8kg are placed at different heights as shown in figure below then the ratio of their potential energies at these points will be

(a) 1:1 (b) 1:2

5. A bullet of mass m is moving horizontally with speed v is stopped by sand in its path. If it covers distance d before coming to rest then average retarding force acting on the bullet will be

6. A ball of mass 1/2kg is released from a height of 50m and after rebound it. Reaches to height of 10m. The percentage loss in energy will be

(a) 20%

(b) 40%

(c) 60%

7. If a boat propeller engine exerts a force of 100N to overcome the drag force and move the boat with constant velocity 20ms-1 then power of the engine will be (b) 2000W

(c) 5000W

8. A ball of mass 1kg rolls down from a smooth surface as shown in figure below then its speed at

(a) 1.4ms⁻¹

(b) 7ms⁻¹

By AZHAR IOBAL 0336-7098894

9. A body of mass 2kg is thrown vertically upward with kinetic energy 300J then maximum height (a) 5m

10. Four motors having different powers are kept running for different time. Which motor does the

(60)	Power	Time

39. A 4kg body is thrown vertically upward from the ground with a velocity of 5ms-1. Its K.E just

before hitting the ground is: (b) 6W (a) 8W

(c) 10W

(d) 14W

40. 1MWh is equal to (a)  $36x10^8$ J

(b) 3.6J

(c) 3.6MJ

(d) 3.6x1091

41. A 2kg body falls from a high tower. After falling 100m, its K.E will be:

(a) 0.2KJ

(b) 1KJ

(c) 2KJ

(d) 20KJ

42. Four particles have same K.E. then which has maximum momentum:

(a) Proton

(b) Electron

(c) Positron

(d) α-particle

43. If escape velocity is v1 for a 10kg mass and v2 for a 20kg mass then (c) V1 < V2 (b)  $v_1 > v_2$ (a)  $v_1 = v_2$ 

(d)  $v_1 >> v_2$ 

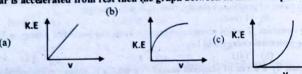

44. If velocity of body becomes n times then its K.E will become

(c) 2n-times

(d) vn-times

K.E

, (b) n²-times (a) n-times 45. A car is accelerated from rest then the graph between its K.E and speed will be

46. A boat propeller moving with velocity 10m/s has maximum power 500W then the force exerted by the propeller is:

(a) 5N

(b) 50N

(c) 500N

47. If a body covers a displacement 10m with rate of change of momentum 10kg ms-2, then work on the body is

(c) 100J

48. A car is moving with uniform velocity then the work done by engine, friction, and net force are

..... respectively (a) +ve.-ve.zero

(b) -ve.zero,+ve

(c) -ve,zero,+ve

(d) +ve,zero,-ve

49. Force-displacement graph of a body is shown in the figure below. Then change in energy of the body is

(a) 40J

(b) 300J

(c) 400J

50. If acceleration and velocity are perpendicular to each other then the work done on the body is:

(a) Positive

(b) Negative

PRACTI	CF	TEST	NO	2
			NU.	. 3

Which of the following is the greater value of work?

(a) 100J

(b) 300J

(c) -300J

(d) -500J

(a) -500J A person holding a bag of 10kg moving with the velocity of 20m/s then the work done by gravity

(a) 10Nm

(b) 20Nm

(c) 200Nm

(d) Zero

Which of the following is not a unit of power? (b) Horse power (c) erg/s (d) W-hour

WORK AND ENERGY

If momentum of the body is increased by 100% then its K.E will increase by: (b) 200%

(c) 300%

(d) 400%

(a) 100% 5. Area under the graph between force and velocity will give: (a) Work done

(b) Power

(c) K.E

(d) Total energy

When a person lifts a body from the ground the work done by his applied force is?

(a) Positive

(b) Negative

(c) Zero

(d) 1

Work done by simple pendulum in one complete oscillation is:

(a) Mgd

(c) Zero

What is the power of the body if forces acting on a moving body are shown in the figure below:

(b) 6W

(c) 10W

(d) 14W

9. A diver weighing 200N jumps from a 10m high board. What will be its velocity when its height is

(a) 3m/s

(b) 6m/s

(c) 9m/s

(d) 12m/s

10. Which of the following is a scalar quantity:

(a) Work

(b) Electric field

(c) Acceleration

(d) Displacement 11. A force of 5N acts on a 15kg body initially at rest. The work done by the force during the first second of motion of the body is:

(a) 75J (b) 5/6J

(d) 5J

12. A force F = 81 + 35 newton is applied over a particle which displaces it from its origin to the

(b) 11J 13. Two bodies of masses m₁ and m₂ have equal K.E. If p₁ and p₂ are their respective momentum, then ratio p1:p2 is equal to:

(a). m₁:m₂

(b)  $m_1^2:m_2^2$ 

point r = 2i - 1j meters. The work done on the particle is:

(c)  $\sqrt{m_2}$ :  $\sqrt{m_1}$ 

 $\sqrt{m_1}:\sqrt{m_2}$ 

14. A force of  $2\hat{i} + 4\hat{j} + 6\hat{k}$  N gives displacement of  $10\hat{j}$ m. The work done is:

15. Energy required to accelerate a car from 10 to 20ms. compared with that required to accelerate from 0 to 10 m/s in the same interval of time covering the same distance is:

(a) Three times (b) Twice (c) Four times

(d) Same

16. A body falls from the height h. After falling a distance S its speed will be: (d)  $\sqrt{2g(S-h)}$ (c)  $\sqrt{2g(h-S)}$ 

(a) One fourth the initial height

(b) Half the initial height

(c) Three fourth the initial height

(d) None of these

18. A force of  $2\mathbf{i} + 3\mathbf{j} + 4\hat{k}$  N acts on a body for 4s, produces a displacement of  $3\mathbf{i} + 4\mathbf{j} + 5\hat{k}$  m. The power is: (c) 4.5 W (d) 6.5 W (b) 7.5 W (a) 9.5 W

19. Work done on the body depends upon

Force applied on the body

Displacement covered by the body

Angle between force and displacement

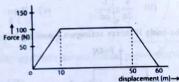

All of these

20. A man pushes a lawn mover through a distance 50m by a force 10N which makes an angle 45° with horizontal, what is work done by man

(b) 350J

(c) 450J

21. If force-displacement graph for a body is shown in the figure below then work done on the body

(a) Zero

(b) 5KJ

(c) 6KJ

(d) 10KJ

22. Absolute P.E of an object is minimum

(a) On the surface of earth

(b) At infinity

(d) At a height equal to radius of earth (c) At the center of earth

23. Energy consumed by a 500W bulb in 10h is

(b) 5KWh (a) 0.5KWh

(c) 5KJ

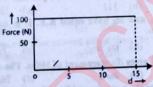

(d) 50MJ

24. If 5000kg aero plane is moving in a vertical circle of radius 1km then work done by gravity during its motion from lowest point to highest point will be

 $-5 \times 10^7$  (c)

 $-1 \times 10^{8}$ 

25. Force-displacement graph for a falling body is shown in the figure below. What is gain in K.E of the body after 10m.

(d) 1.5KJ

(b) 1KJ (c) 1.5J 26. show force-displacement graph is shown in the figure below What is net change in energy of a bod

iy? (a) 5J	(b)	50J			(c) 1	50J	1	(d) Zero

WORK AND ENERGY

27. A 2kg ball moving with velocity 10ms⁻¹ is brought to rest in 20 sec What is work done on the ball? (c) -100J 18. If both mass and velocity of a body are doubled then its K.E will become (d) -200J

(a) Double (c) Eight times 29. If a half kg ball is moving with constant velocity  $(4i+3j)ms^{-1}$  then its K.E will be (d) Sixteen times

(a) 3.7J (c) 12.5J (d) 15.751

30. If a car is decelerating down from a hill station then its K.E and P.E.

(a) Increase and decrease (b) Decrease and increase (c) Both decrease

(d) Both increase

31. If a 1kg body is moving with kinetic energy 200J then its momentum will be (a) 10 N.s (b) 20 N.s

(c) 25 N.s. (d) 50 N.s. 32. If an object of mass 2kg dropped from a height 15m then its velocity at a height 10 will be

(a) 4ms-1 33. Effect of work is equal to

(b) 10ms⁻¹

(c) 14ms⁻¹

(d) 19ms⁻¹

(a) Change in total energy

(b) Change in kinetic energy (d) Both a & b

(c) Change in power

34. If a horse pulls a cart, work done by horse is (a) Negative

(b) Zero (c) Positive

(d) None of these

35. If momentum is increased by 20% then K.E. increase by: (c) 44%

(a) 20% (b) 40%

(d) 86%

36. A body of mass 10 kg is travelling with uniform speed of 5 m/s. Its kinetic energy is (a) 125 J (b) 250 J (c) 500 J (d) 255 J 37. A stone of 1 kg is thrown upward it reaches a max height of 5m, work done by the gravity is:

(a) 50 J (b) 49 J

(c) -49 J

(d) 55 J

38. The linear momentum is increased by 10%, percentage change in the kinetic energy will be: (a) 21% (b) 11% (c) 22% (d) 10%

39. The SI unit of power is? (a) Hz (b) Sec

(c) Watt

(d) Joules

40. A block of mass 50 kg slide over a horizontal distance of 1 m, if the coefficient of between the surfaces is 0.2 then work done against friction is (a) 98J (d) 34J

(b) 721

(c) 56J

41. A block of mass 60 kg just slides over a horizontal distance of 0.9 m. If the coefficient of friction

(a) 79.4 J (b) 97.54 J (c) 105.25 J 42. The value of acceleration due to gravity on moon is _ of earth:

(a) One forth

(b) 1/10 th

between their surfaces is 0.15 then work done against friction will be:

(c) 2/3

(d) 1/6

(d) 81 J

(d) 12 J

43. If force is F = 4i - 2j and displacement is d = 3i + 4j, the work done will be: (a) 4 J (b) 8 J (c) 2 J

44. In which of the following the work is done by the variable force (a) Extension produced in spring

(b) Rocket moving away from earth

(c) Charges moving toward each other

(d) All of these

45. When mass and speed of the body are doubled, K.E of body will become: (a) 4 times (b) 8 times

46. A neutron of mass 1.67x10⁻²⁷kg covers a distance 12m in 3.6x10⁻⁴ sec with uniform speed what is

(a) 9.3x10⁻⁹J

(b) 9.3x10⁻¹⁴J

(c) 9.3x10⁻¹⁹J

(d) 9.3x10⁻²⁹J

## PRACTICE TEST NO. 4

1. At which of the following angle between force and displacement, work is maximum:

(a) 20

(b) 40

(c) 60

2. A force of 40N acts on a body and it covers the displacement 2m. If the work done on the body 40J then angle between force and displacement is

(a)  $\pi/3$ rad

(b)  $\pi/2$ rad

(c) π/6rad

(d)  $\pi/2$ rad

3. If force-displacement graph for different bodies is shown in the figure below then the work done is maximum for:

4. Which of the following force is not a conservative force?

(a) Elastic force

(b) Friction

(c) Gravitational force

(d) Electric force

5. A 1000W motor runs for 1h then work done by the motor is:

(a) 3.6J

(b) 3.6KJ

(c) 3.6MJ

6. Which of the following is used as unit of electrical energy? (c) erg

(b) Ev

7. Two bodies of equal masses are moving with velocities 2m/s and 6m/s then ration between their K.E will be: (c) 1:9

(b) 3:1

(a) 1:3 8. For which of the following force the work done depends on the path followed

(a) Electric force

(b) Gravitational force

(c) Frictional force

(d) Elastic force

(c) Magnetic force (c) Magnetic force (c) Magnetic force (d) None of these (d) None of these (e) Immand $\theta=1^{\circ}$ then what is the value of S (a) 0.01745m (b) Im (c) 2m (d) None of these (e) (a) 0.01745m (b) Im (c) 2m (d) None of these (e) Galled (a) Bending force (b) Centripetal force (c) Centrifugal force (d) Normal for the angular displacement of an object after one complete revolution is:  (a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad Angular velocity of hour-hand of a mechanical watch is:  (a) Zero/day (b) $\pi$ rad/oh (c) $1 \text{ rev}/12\text{h}$ (d) All Aparticle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in m/s is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N (d) 250N (d) 250N (e) 750N (d) 250N (d) 250N (e) 750N	usho
(a) Maginet sheen what is the value of S (a) 0.01745m (b) Im (c) 2m (d) None A force which acts on an object moving in a circle and is directed towards the center of the galled (a) Bending force (b) Centripetal force (c) Centrifugal force (d) Normal for The angular displacement of an object after one complete revolution is:  (a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad Angular velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ red (d) $\pi$ rad/6h (c) $1\pi$ rev/12h (d) All Aparticle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in m/s is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N The magnitude of centripetal force acting on a body of mass mexecuting uniform motion circle of radius r with speed v is:  (a) $v/r^2$ (b) $mv^2/r$ (c) $v/r$ (d) Mvr Angular displacement covered by minute hand in 20 minutes is:  (a) $w/r^2$ (b) $\pi/3$ rad (c) $\pi/6$ rad (d) $2\pi/3$ rad A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $\pi/2$ rad (b) $\pi/3$ rad (c) $\pi/6$ rad (d) $2\pi/3$ rad (a) $\pi/2$ rad (b) $\pi/3$ rad (c) $\pi/6$ rad (d) $2\pi/3$ rad (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled Combodies of mass 10kg and 5 kg moving in concentric orbits of radii R and r such that centripetal force to keep the same speed should be:  (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled (a) Price of radius and the centripetal acceleration is:  (a) $R/r$ (b) $r^2/r^2$ (c) $r/R$ (d) $R^2/r^2$ (d) $R^2/r^2$ (d) $R^2/r^2$ (e) $R^2/r^2$ (f) $R^2/r^2$	
If $r = 1m$ and $\theta = 1^{\circ}$ then what is the value of S (a) 0.01745m (b) Im (c) 2m (d) None A force which acts on an object moving in a circle and is directed towards the center of the is called (a) Bending force (b) Centripteal force (c) Centrifugal force (d) Normal for The angular displacement of an object after one complete revolution is: (a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad Angular velocity of hour-hand of a mechanical watch is: (a) $2\pi$ revolving is a circle of radius 25cm at two revolutions per second. The acceleration particle in $m/s^3$ is: (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripteal force (a) 1000N (b) 1200N (c) 750N (d) 250N The magnitude of centripteal force acting on a body of mass m executing uniform motion circle of radius $r$ with speed $v$ is: (a) $v/r^2$ (b) $m/r^2$ (c) $v/r$ (d) $m/r^2$ Angular displacement covered by minute hand in 20 minutes is: (a) $v/r^2$ (b) $m/r^2$ (c) $m/r^2$ (c) $m/r^2$ (d) $m/r^2$ A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $m/r^2$ rad (b) $m/r^2$ rad (c) $m/r^2$ for ad (d) $m/r^2$ rad (e) $m/r^2$ rad (f) $m/r^2$ rad (g) $m/r^2$ rad (	
Angular velocity of hour-hand of a mechanical watch is:  (a) $2 \text{ero}$ (b) $\pi$ rad  (c) $2\pi$ rad  (d) Normal for the angular displacement of an object after one complete revolution is:  (a) $2 \text{ero}$ (b) $\pi$ rad  (c) $2\pi$ rad  (d) $\frac{\pi}{3}$ rad  Angular velocity of hour-hand of a mechanical watch is:  (a) $2 \text{ero}$ (b) $\pi$ rad/6h  (c) $1 \text{ rev}/12 \text{h}$ (d) All Aparticle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N  (b) 1200N  (c) 750N  (d) 250N  The magnitude of centripetal force acting on a body of mass mexecuting uniform motion circle of radius r with speed v is:  (a) $\sqrt{r^2}$ (b) $m^2/r$ (c) $\sqrt{r}$ (d) $\sqrt{r}$ Angular displacement covered by minute hand in 20 minutes is:  (a) $\sqrt{r^2}$ (b) $m^2/r$ (c) $\sqrt{r}$ (d) $\sqrt{r}$ rad (d) $\sqrt{r}$ rad Abody moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $R\omega$ (b) $Z$ cro (c) $R\omega^2$ (d) $\frac{\omega^2}{R}$ Aparticle is moving in a circle of radius R with constant speed v. If radius is double the centripetal force to keep the same speed should be:  (a) Unchanged  (b) Halved  (c) Doubled  (d) Quadrupled velocity on a circle of radiu R and r such that periods are same. Then the ratio between their centripetal acceleration is:  (a) $Rr$ (b) $r^2/r^2$ (c) $r/R$ (d) $R^2/r^2$ leaves turns around a curve at 10Km/h. If he turns at double the speed, the tendem verturn is:  (a) $Rr$ (b) $R^2/r^2$ (c) $R^2/r^2$ (d) $R^2/r^2$ (e) $R^2/r^2$ (f) $R^2/r^2$ (f) $R^2/r^2$ (g) $R^2/r$	
A force which acts on an object moving in a circle and is directed towards the center of the is called (a) Bending force (b) Centriptetal force (c) Centrifugal force (d) Normal for The angular displacement of an object after one complete revolution is:  (a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad Angular velocity of hour-hand of a mechanical watch is:  (a) Zero/day (b) $\pi$ rad/oh (c) $1\pi$ velocity 12h (d) All Aparticle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) $1000\text{N}$ (b) $1200\text{N}$ (c) $750\text{N}$ (d) $250\text{N}$ The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius r with speed v is:  (a) $\pi/r^2$ (c) $\pi/r^2$ (c) $\pi/r^2$ (d) $\pi/r^2$ Angular displacement covered by minute hand in 20 minutes is:  (a) $\pi/r^2$ (d) $\pi/r^2$ Abody moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $\pi/r^2$ (b) $\pi/r^2$ and (b) $\pi/r^2$ and (c) $\pi/r^2$ and (d) $\pi/r^2$ Abody moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $\pi/r^2$ (c) $\pi/r^2$ (c) $\pi/r^2$ (d) $\pi/r^2$ (e) $\pi/r^2$ (e) Doubled (d) Quadrupled (e) Unchanged (b) Halved (c) Doubled (d) Quadrupled (e) Unchanged (f) Halved (f) Doubled (f) Quadrupled (g) $\pi/r^2$ (g)	
(a) Bending force (b) Centripetal force (c) Centrifugal force (d) Normal for The angular displacement of an object after one complete revolution is:  (a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad Angular velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of a circle of radius 25cm at two revolutions per second. The accelerate particle in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N  The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius $\pi$ with speed $\pi$ via:  (a) $\pi/r^2$ (b) $\pi/r^2$ (c) $\pi/r^2$ (d) $\pi/r^2$ Angular displacement covered by minute hand in 20 minutes is:  (a) $\pi/r^2$ rad (b) $\pi/r^2$ rad (c) $\pi/r^2$ rad (d) $\pi/r^2$ rad A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $\pi/r^2$ rad (b) $\pi/r^2$ rad (c) $\pi/r^2$ rad (d) $\pi/r^2$ rad A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $\pi/r^2$ rad (b) $\pi/r^2$ rad (c) $\pi/r^2$ rad (d) $\pi/r^2$ rad (e) $\pi/r^2$ rad (e) $\pi/r^2$ rad (f) $\pi/r^2$ rad (f) $\pi/r^2$ rad (f) $\pi/r^2$ rad (g) $\pi/r^2$ rad rad rotated in a circle with a constant speed (e) $\pi/r^2$ rad/sec (f) $\pi/r^2$ rad/sec (g) $\pi/r^2$	
(a) Bending force (b) Centripetal force (c) Centrifugal force (d) Normal for The angular displacement of an object after one complete revolution is:  (a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad Angular velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of hour-hand of a mechanical watch is:  (a) $2\pi$ velocity of a circle of radius 25cm at two revolutions per second. The accelerate particle in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N  The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius $\pi$ with speed $\pi$ via:  (a) $\pi/r^2$ (b) $\pi/r^2$ (c) $\pi/r^2$ (d) $\pi/r^2$ Angular displacement covered by minute hand in 20 minutes is:  (a) $\pi/r^2$ rad (b) $\pi/r^2$ rad (c) $\pi/r^2$ rad (d) $\pi/r^2$ rad A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $\pi/r^2$ rad (b) $\pi/r^2$ rad (c) $\pi/r^2$ rad (d) $\pi/r^2$ rad A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $\pi/r^2$ rad (b) $\pi/r^2$ rad (c) $\pi/r^2$ rad (d) $\pi/r^2$ rad (e) $\pi/r^2$ rad (e) $\pi/r^2$ rad (f) $\pi/r^2$ rad (f) $\pi/r^2$ rad (f) $\pi/r^2$ rad (g) $\pi/r^2$ rad rad rotated in a circle with a constant speed (e) $\pi/r^2$ rad/sec (f) $\pi/r^2$ rad/sec (g) $\pi/r^2$	circ
The angular displacement of an object after one complete revolution is:  (a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad  Angular velocity of hour-hand of a mechanical watch is: (a) $2 \operatorname{rev}/\operatorname{day}$ (b) $\pi$ rad/6h (c) $1 \operatorname{rev}/\operatorname{12h}$ (d) All  A particle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in $\operatorname{m/s^2}$ is: (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N  The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius r with speed v is: (a) $v/r^2$ m (b) $mv^2/r$ (c) $v/r$ m (d) Mvr  Angular displacement covered by minute hand in 20 minutes is: (a) $v/r^2$ m (b) $mv^2/r$ (c) $v/r$ m (d) Mvr  Angular displacement covered by minute hand in 20 minutes is: (a) $v/r^2$ and (b) $v/r^2$ and (c) $v/r^2$ and (d) $v/r^2$ and A body moves with constant angular velocity on a circle. Magnitude of angular acceleration $v/r^2$ and A body moves with constant angular velocity on a circle. Magnitude of angular acceleration $v/r^2$ and $v/r^2$	
(a) Zero (b) $\pi$ rad (c) $2\pi$ rad (d) $\frac{\pi}{3}$ rad Angular velocity of hour-hand of a mechanical watch is:  (a) $2\text{rev}/\text{day}$ (b) $\pi$ rad/6h (c) $1\text{ rev}/12\text{h}$ (d) All Aparticle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) $1000\text{N}$ (b) $1200\text{N}$ (c) $750\text{N}$ (d) $250\text{N}$ The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius r with speed v is:  (a) $\sqrt{r}$ (b) $m^2/r$ (c) $\sqrt{r}$ (d) $\sqrt{r}$ Magular displacement covered by minute hand in 20 minutes is:  (a) $\sqrt{r}$ (b) $\pi/3$ rad (c) $\pi/6$ rad (d) $2\pi/3$ rad Abdy moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $R\omega$ (b) Zero (c) $R\omega^2$ (d) $\frac{\omega^2}{R}$ A particle is moving in a circle of radius R with constant speed v. If radius is double the centripetal force to keep the same speed should be:  (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled Two bodies of mass $10\text{kg}$ and $5\text{kg}$ moving in concentric orbits of radii R and r such that periods are same. Then the ratio between their centripetal acceleration is:  (a) $R/r$ (b) $r^2/r^2$ (c) $r/R$ (d) $R^2/r^2$ The ratio of angular speeds of minute hand and hour hand of watch is:  (a) $R/r$ (b) $R/r^2$ (c) $R/r^2$ (d) $R/r^2$ (d) $R/r^2$ (e) $R/r^2$ (d) $R/r^2$ (e) $R/r^2$ (f) $R/r^2$ (g) $R/r^2$ (f) $R/r^2$ (f) $R/r^2$ (g) $R/r^2$ (g) $R/r^2$ (h) $R/$	ce
Angular velocity of hour-hand of a mechanical watch is:  (a) $2 \operatorname{rev}/\operatorname{day}$ (b) $\pi \operatorname{rad}/\operatorname{6h}$ (c) $1 \operatorname{rev}/12h$ (d) All  A particle moves in a circle of radius 25cm at two revolutions per second. The accelerate in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) $1000N$ (b) $1200N$ (c) $750N$ (d) $250N$ The magnitude of centripetal force acting on a body of mass mexecuting uniform motion circle of radius r with speed v is:  (a) $\pi/r^2m$ (b) $mv^2/r$ (c) $\pi/r^2m$ (d) Mvr  Angular displacement covered by minute hand in 20 minutes is:  (a) $\pi/r^2$ rad (b) $\pi/r^2$ rad (c) $\pi/r^2$ frad (d) $2\pi/r^2$ rad  A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $R\omega$ (b) Zero (c) $R\omega^2$ (d) $\frac{\omega^2}{R}$ A particle is moving in a circle of radius R with constant speed v. If radius is double the centripetal force to keep the same speed should be:  (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled periods are same. Then the ratio between their centripetal acceleration is:  (a) $R/r$ (b) $r^2/r^2$ (c) $r/R$ (d) $R^2/r^2$ The ratio of angular speeds of minute hand and hour hand of watch is:  (a) $R/r$ (b) $R^2/r^2$ (c) $R/r$ (d) $R^2/r^2$ The ratio of angular speeds of minute hand and hour hand of watch is:  (a) $R/r$ (b) $R/r^2$ (c) $R/r$ (d) $R/r^2$ The ratio of angular speeds of minute hand and hour hand of watch is:  (a) Unchanged (b) Quadrupled (c) Halved (d) Doubled has string is released, the stone flies:  (a) Unchanged (b) $R/r^2$ (c) $R/r^2$ (d) $R/r^2$ (e) $R/r^2$ (e) $R/r^2$ (f) $R/r^2$ (f) $R/r^2$ (f) $R/r^2$ (f) $R/r^2$ (f) $R/r^2$ (f) $R/r^2$ (e) $R/r^2$ (f) $R/r^$	
Angular velocity of notification of a mechanical watch is:  (a) $2 \operatorname{rev/day}$ (b) $\pi \operatorname{rad/6h}$ (c) $1 \operatorname{rev/12h}$ (d) All A particle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N  The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius r with speed v is:  (a) $v/r^2$ (b) $mv^2/r$ (c) $v/r$ (d) Mvr  Angular displacement covered by minute hand in 20 minutes is:  (a) $\pi/2 \operatorname{rad}$ (b) $\pi/3 \operatorname{rad}$ (c) $\pi/6 \operatorname{rad}$ (d) $2\pi/3 \operatorname{rad}$ A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a) $R\omega$ (b) Zero (c) $R\omega^2$ (d) $\frac{\omega^2}{R}$ A particle is moving in a circle of radius R with constant speed v. If radius is double the centripetal force to keep the same speed should be:  (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled periods are same. Then the ratio between their centripetal acceleration is:  (a) $R/r$ (b) $r^2/r^2$ (c) $r/R$ (d) $R^2/r^2$ The ratio of angular speeds of minute hand and hour hand of watch is:  (a) $122$ (b) $61$ (c) $16$ (d) $122$ verturn is:  (a) Unchanged (b) Quadrupled (c) Halved (d) Doubled atone of mass m is tied to a string of length L and rotated in a circle with a constant speed were any magniture acceleration $mv^2$ (e) Radially outward (d) Radially inward (e) Radially outward (d) Radially inward (e) Radially outward (d) Radially inward (e) Radially outward (f) Radially inward (e) Along the circumference of the circle (d) Along the radius	
A particle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in m/s² is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N  The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius r with speed v is:  (a) $\sqrt{r}$ (b) $mv^2/r$ (c) $v/rm$ (d) Mvr  Angular displacement covered by minute hand in 20 minutes is:  (a) $\pi/2$ rad (b) $\pi/3$ rad (c) $\pi/6$ rad (d) $2\pi/3$ rad  A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a)  Rw (b) Zero (c) Rw² (d) $\frac{\omega^2}{R}$ A particle is moving in a circle of radius R with constant speed v. If radius is double the centripetal force to keep the same speed should be:  (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled Two bodies of mass 10kg and 5 kg moving in concentric orbits of radii R and r such that periods are same. Then the ratio between their centripetal acceleration is:  (a) $R/r$ (b) $r^2/r^2$ (c) $r/R$ (d) $R^2/r^2$ The ratio of angular speeds of minute hand and hour hand of watch is:  (a) 12:1 (b) 6:1 (c) 1:6 (d) 1:12  A cyclist turns around a curve at 10Km/h. If he turns at double the speed, the tendem contains a string of length L and rotated in a circle with a constant speed watch as time of mass m is tied to a string of length L and rotated in a circle with a constant speed (e) Radially outward (d) Radially inward (a) $\pi$ rad/sec (b) $\pi$ rad/sec (c) $\pi$ rad/sec (d) $\pi$ rad/sec (d) $\pi$ rad/sec (e) Along the circumference of the circle (d) Along the radius	
A particle moves in a circle of radius 25cm at two revolutions per second. The accelerate particle in $m/s^2$ is:  (a) $2\pi^2$ (b) $4\pi^2$ (c) $8\pi^2$ (d) $\pi^2$ A 500kg car takes a round turn of radius 50m with a velocity 36 km/h. The centripetal force (a) 1000N (b) 1200N (c) 750N (d) 250N The magnitude of centripetal force acting on a body of mass m executing uniform motion circle of radius r with speed v is: (a) $v/r^2m$ (b) $mv^2/r$ (c) $v/rm$ (d) Mvr Angular displacement covered by minute hand in 20 minutes is: (a) $v/r^2m$ (b) $m/3$ rad (c) $\pi/6$ rad (d) $2\pi/3$ rad A body moves with constant angular velocity on a circle. Magnitude of angular acceleration (a)  R $\omega$ (b) Zero (c) $R\omega^2$ (d) $\frac{\omega^2}{R}$ A particle is moving in a circle of radius R with constant speed v. If radius is double the centripetal force to keep the same speed should be: (a) Unchanged (b) Halved (c) Doubled (d) Quadrupled Two bodies of mass 10kg and 5 kg moving in concentric orbits of radii R and r such that periods are same. (a) Changes in direction

(b) Changes in magnitude

(c) Changes both in magnitude and direction

(d) Remains constant

33. The force required to move a body of mass 1kg with velocity 10m/s along circular path of radius 0.1m:

(b) 1N

(c) 1000N

34. A body moves from one end of diameter to other end. If radius of circle is 1m then its angular displacement will be: (b)  $\frac{\pi}{2}$  rad (c)  $\pi$  rad

(a)  $\frac{\pi}{1}$  rad

35. If a grid rod pivoted at point O is rotating around its own axis as shown in the figure below, then which point is moving faster

(a) A

(b) B

(c) C

All have same speed

36. If a tyre of radius 0.5m is rolling without slipping then its horizontal covered in 3 revolution is about:

(a) 5.4m

(b) 9.4m

(c) 14.4m

(d) 20m

37. Angular speed of daily rotation of earth is:

(a)  $\pi/24 \text{ rad/h}$ 

(b) π/6 rad/h

(c)  $\pi/2 \text{ rad/h}$ 

(d)  $\pi/12 \text{ rad/h}$ 

38. A body moving along a circular path completes a round trip. The angular displacement is: (c) Zero

(b) 2r (a)  $2\pi$ 

39. A stone tied to the end of 20cm long string is whirled in a horizontal circle. If the centripetal acceleration is 9.8m/sec2, its angular speed in rad/s is:

(b) 22/7

40. If mass, speed and radius of circular path are doubled then required centripetal force will become: (d) Sixteen times

(b) Four times

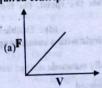

(c) Eight times

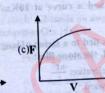

41. A particle is moving in circular path of radius  $1/\pi$  m with time period 2s, then its rate of change (a) Double of velocity will be:

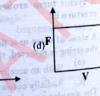

(b)  $2\pi \text{ m/s}^2$ 

(c)  $\pi/2 \text{ m/s}^2$ 

42. A particle of mass m is moving in a circular path of radius r then the graph between speed and required centripetal force is:

43. If angular frequency is doubled, centripetal force is

(b) Four times

(d) Remain same

(c) Eight times (a) Twice 44. The angular velocity will become equal to linear velocity when r becomes (b) Very very small

(a) Zero (c) Unity

(d) Very very large

ROTATIONAL AND CIRCULAR MOTION

45. The frequency of a particle performing circular motion changes from 60 rpm to 180 rpm in 20s then the angular acceleration is

(a)  $0.1\pi/\text{rads}^2$ 

(b)  $12\pi \text{ rad/s}^2$ 

(c)  $3\pi \text{ rad/s}^2$ 

(d)  $40\pi \text{ rad/s}^2$ 

(a) 40π rad/s²

46. A car is moving in a circular track of radius 20m at a constant speed of 20m/sec. Find the centripetal acceleration: (b)  $40 \text{ m/s}^2$ (c)  $30 \text{ m/s}^2$ (d)  $10 \text{ m/s}^2$ 

(a) 20 m/s²

(a) 10 m/s²

47. Circular motion of a particle while attached to a string centripetal acceleration is provided by: (a) Tension in string (b) Gravitational force

(c) Normal force

(d) None of these 48. Determine the angular displacement in radians of 6.5 revolutions:

(a) 40.8 radians

(b) 4 radians

(c) 3 radians

(d) 36 radians

49. Find angular acceleration when  $\Delta\omega$  is 250 rpm and  $\Delta t$  is 5.00 s: (a) 5.24 rad/sec² (b) 6 rad/sec²

(c) 10 rad/sec²

(d) None of these

50. Determine the linear velocity of a point rotating at an angular velocity of  $12 \pi$  radians per second at a distance of 8 centimeters from the center of the rotating object:

(a) 31.6 cm/s

(b) 301.6 cm/s

(c) 30.6 cm/s

(d) 3016 cm/s

### PRACTICE TEST NO. 2

1. Angular speed of minutes hand of mechanical watch is:

(a)  $\frac{\pi}{30}$  radm⁻¹

(b)  $\frac{\pi}{2} \ rad m^{-1}$ 

(c)  $\frac{\pi}{12} radm^{-1}$ 

(d)  $\pi$  radm⁻¹

2. Two bodies of equal masses are moving on two circular paths of radii in ratio 1:2, with same angular velocity. The ratio of centripetal forces acting on these bodies is:

(a) 4:1 (b) 2:1

3. Two cars of masses of m1 and m2 are moving along the circular path of radius r1 and r2. They take one round in the same time. The ratio of angular velocity of two cars will be: (b)  $m_1r_1:m_2r_2$ (c) 1:1

4. If two bodies having moment of inertia 10kgm2 and 20kgm2. If they are subjected to same

amount of torque then the ratio between their angular acceleration will be:

(b) 2:1 5. A particle is acted upon by a force of constant magnitude which is always perpendicular to the velocity of the particle. The motion takes place in a plane. It follows that:

(a) Its velocity is constant (c) Its K.E is constant

(b) It moves in a circular path

(d) Both B and C 6. The centripetal force required to keep the body in circular path is F1. What would be centripetal force if radius becomes two times keeping same angular velocity:

(b) F₁/4

(c) 4F₁

7. A particle moving in a circular path may have:

(a) Tangential acceleration (c) Radial acceleration

(b) Angular acceleration

8. If a particle of mass m is moving in a circular path of radius r with time period T then the (d) All of these

expression for required centripetal force will be:

 $4\pi^2 mr$ 

 $4\pi^2 mT^2$ 

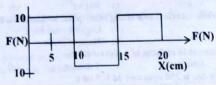

AT PREP BOO

(a) 100J

(d) 50J

9.	A fan is switched off ar	d its completes 20 revolu	tions before coming to	rest, with uniform angula
	acceleration -10rev/s ² t (a) 10π rad/s	hen its initial angular vel (b) 20π rad/s	(c) 30π rad/s	(d) 40π rad/s

10. The figure shows the force distance graph of a body moving along a straight line. The work done

11. If the body is moving in a circle of radius r with constant speed v, its angular velocity:

(c) vr 12. When body moves with a constant speed along a circle:

(b) -100J

(a) Its velocity remains constant

No work is done on it

(c) 200J

No acceleration is produced in the body (c) No force acts on the body

13. A particle is moving in a horizontal circle with constant speed. It has constant:

(c) Acceleration (b) Displacement (d) Velocity (a) K.E 14. A particle moves with constant angular velocity in a circle. During the motion its:

(b) Energy is conserved (a) Momentum is conserved

(d) None of the above is conserved (c) Both momentum and energy are conserved

15. Direction of angular acceleration is always along the direction of:

(c) Force (d) Torque (a) Velocity (b) Displacement

16. A car moving on a horizontal road may be thrown out of the road in taking a turn:

(b) Due to rolling friction force between tyre and (a) Due to the reaction of the ground road

(d) Due to lack of sufficient centripetal force (c) By the gravitational force

17. A body is moving in a circular path with a constant speed. It has:

(b) A constant velocity (a) A constant momentum

(d) An acceleration of constant magnitude (c) A constant acceleration

18. Certain neutron stars are believed to be rotating at about 1rev/sec. If such a start has radius of 20km, the acceleration of an object on the equator of the start will be: (d) 4x108m/sec2

(c) 20x108m/sec2 (b) 8x10⁵m/sec² (a) 120x10⁵m/sec² 19. In uniform circular motion, the velocity vector and acceleration vector are:

(b) Same direction (a) Not related to each other

(c) Opposite direction

(d) Perpendicular to each other

20. If a particle covers half the circle of radius R with constant speed then:

(a) Change in K.E is zero

(b) Change in K.E is my

(d) Momentum change is myr

21. A body of mass 5kg is moving in a circle of radius 1m with angular velocity of 2 radian/ sec. The centripetal force is:

(a) 40N

(b) 20N

(c) 30N

22. The angular speed of seconds needle in a mechanical watch is:

(a)  $\frac{n}{20}$  rads⁻¹

(b)  $\frac{\pi}{10}$  rods⁻¹

(c)  $\pi rads^{-1}$ 

(d)  $2\pi \text{ rads}^{-1}$

ROTATIONAL AND CIRCULAR MOTION 23. A particle of mass m is executing uniform circular motion on a path of radius r. If p is the A particle of its linear momentum. The radial force acting on the particle is: (c)  $mp^2/r$ (a) p²/rm

24. A particle moves with constant angular velocity in circular path of certain radius and is acted A particle into a certain centripetal force F. If the angular velocity is doubled, keeping radius same, the new force will be: (a) F/2 (d) F2 25. SI unit of angular displacement is: (b) Revolution (a) Degree (c) Radian (d) All of these 26. If a rotating body is moving anti-clockwise, the direction of angular velocity is: (a) Towards the centre (b) Along the linear velocity (c) Away from the center (d) Perpendicular to both radius and linear velocity 27. One rpm is equal to.... rad/sec: (b) 1.5 28. When a body moves in a circle, the angle between its linear velocity and angular velocity is always? (b) 0 (a) 180 (c) 29. The centripetal force is zero when centrifugal force is (a) Minimum (b) Zero (c) Maximum (d) Infinity 30. An angular velocity of 60 revolutions per minute is the same as: (b) 2π rad/s (a)  $\pi rad/s$ (c) 4π rad/s (d) 360° degree s-1 31. 7 Radian is equal to degree approximately: (a) 300 (b) 500 (c) 400 (d) None of these 32. The ratio of angular speed of the minute hand of clock to that of its hour hand is: (a) 3600:1 (b) 24:1 (c) 60:1 33. The dimensions of angular velocity are: (a)  $[LT^{-1}]$ (b) [LT-2] (c) [LT] 34. What is the measure in radians of the angle A = 330°? (a)  $11\pi/3$ (b)  $7\pi/4$ (c)  $7\pi/6$ (d)  $11\pi/6$ 35. A mixture grinder rotates clockwise with constant angular velocity 50 rad/s its angular acceleration will be: (a) Zero (b) Negative (c) Uniform but not zero (d) Positive 36. The angular speed of the wheels of a bicycle is  $8\pi$  radian/sec there period of rotation is: (a) 25 sec (b) 4 sec 37. The units of angular velocity are similar to: (c) 1/4 sec (d) 2 sec (a) Angular displacement (b) Angular acceleration (c) Angular frequency 38. Centrifugal acceleration of a car moving around in a circle of radius 5 m with 10 m/s velocity: 39. A car is moving in a circular track of diameter 100m at a constant speed of 40m/sec. Find the (b)  $10 \text{ m/s}^2$ centripetal acceleration? (a)  $42 \text{ m/s}^2$ 40. A body is moving in a circle of constant speed. Which statement is true? (d)  $30 \text{ m/s}^2$ (a) The resultant force acts towards the centre of the circle Resultant force is zero Resultant force is along the tangent (d) Resultant force remains constant 23. 24. 25. 26. 27. 28. 29. 30. 31. 32. 33. 34. 35. 36. 37. 38. 39. 40.

44. If the period of oscillation of mass M suspended from a spring is one second, then the period of mass 4M will be

(a) 2 s

(b) 1/2 s

(c) 4 s

45. Time period of oscillation of a spring is 12 s on Earth. What shall be the time period if it is taken

(a) 12 s

(c) 12 × 6 s

(d)  $16 \times \sqrt{12}$ 

46. For a simple pendulum, the graph between l and T is

(a) Hyperbola

(b) Curved line

(c) Straight line

(d) Parabola

47. What is represented by  $\frac{1}{2}mx_0^2\omega^2$ , where the letters have usual meanings?

(a) Maximum K.E. (b) Maximum P.E

(c) Total energy

(d) All of these

48. What is effect on the time period of a simple pendulum if the length is quadrupled?

(a) Halved

(b) Doubled

(c) No effect

(d) It would be zero

49. In simple harmonic motion,

(a) The velocity and displacement of the vibrating particle are in the same phase.

(b) The velocity and acceleration of the vibrating particle are in the same phase.

(c) The velocity of the vibrating particle is ahead in phase of the displacement by an angle of  $\pi$ .

(d) The acceleration of the vibrating particle is ahead of displacement by a phase of  $\pi$ .

50. The amplitude and the time period in S.H.M is 0.5 cm and 0.4 s respectively. If the initial phase is  $\pi/2$  radian, then equation of S.H.M will be:

(a)  $y = 0.5 \sin 5\pi t$  (b)  $y = 0.5 \sin 4\pi t$  (c)  $y = 0.5 \sin 2.5\pi t$  (d)  $y = 0.5 \cos 5\pi t$

## PRACTICE TEST NO. 3

1. Given: equation of SHM is x = 10sin(20t + 0.5). The initial phase is:

(a) 0.5 radian

(b) 20 radian

(c) 10 radian

(d) None of these

2. A particle executes SHM. The graph of its velocity as a function of displacement is:

(a) a straight line

(b) a circle

(c) an ellipse

(d) a hyperbola

3. A spring-mass system oscillates with a frequency f. If it is taken in an elevator slowly accelerating upward, the frequency will

(a) Increase

(b) Decrease

(c) Remain same

(d) Become zero

4. A simple harmonic oscillator has a period of 0.01 s and an amplitude of 0.2 m. the magnitude of the velocity in ms-1 at the centre of oscillation is:

(a) 100

MDCA EPREP BOOL

(b) 100 π

(c) 20 m

(d) 40 π

5. The acceleration of a particle in simple harmonic motion is:

(a) Always zero

(b) Always constant

Maximum at the extreme position

(d) Maximum at the equilibrium position

Sr.		2	3	4	5
Ans:	a	c	c	d	C

UNIT 04

A body executes simple harmonic motion. The potential energy (P.E), the kinetic energy (K.E.)

A body executes simple harmonic motion. The potential energy (P.E), the kinetic energy (K.E.) A body executing (T.E.) are measured as a function of displacement x. Which of the following statements is true? (a) P.E is maximum when x = 0

**OSCILLATIONS & WAVES** 

K.E is maximum when x = 0

(c) T.E is zero when x = 0

(d) K.E is maximum when x = maximum

(d) The maximum acceleration in a SHM is  $\alpha$  and the maximum velocity is  $\beta$ . The amplitude is:

8. A particle executes an undamped SHM of time period T. Then the time period with the potential energy changes is:

(a) T

(b) 2 T

(c) T/2

(d) T/4

9. A system exhibiting S.H.M must possess:

(a) Inertia only

(c) Restoring force, inertia and external force

Restoring force as well as inertia

(d) Restoring force only

10 Velocity at mean position of a particle executing S.H.M is v, they velocity of the particle at a distance equal to half of the amplitude:

11. A particle executes harmonic motion with an angular velocity and maximum acceleration of 2 rad/s and 8 m/s respectively. The amplitude of oscillation is:

(a) 0.1 m

(b) lm

(c) 0.2m

(d) 2m

12. The total energy of the body executing S.H.M is E. Then the K.E when the displacement is half of the amplitude is:

(a) E/2

(b) 3E/4

(c) E/4

(d)  $\sqrt{3}/4$  E

13. What is constant in S.H.M?

(a) Restoring force (b) Potential energy (c) Kinetic energy 14. If the metal bob of simple pendulum is replaced by a wooden bob, then its time period will:

(d) Time period then decrease

(a) Increase (b) Decrease (c) Remain the same (d) 15. The ratio of frequencies of two pendulum are 2:3, then their length are in ratio:

(a)  $\sqrt{2/3}$ 

(b)  $\sqrt{3/2}$ 

16. A body performs S.H.M. Its K.E varies with time t as indicated by graph:

17. If the density of oxygen is 16 times to that of hydrogen, what will be the ratio of their corresponding velocities of sound waves:

18. The type of waves that can be propagated through solid is:

(d) 1:16 (c) 16:1 (d) None of these

19. What is the phase difference between two successive crest in a wave: (b)  $2\pi$ 

(d)  $4\pi$

		1.16	(b) 1.0	(-) 0.1	

21. Which of the property makes difference between progressive and stationary waves: (a) Amplitude

(b) Frequency

(c) Propagation of energy

(c) Propagation of energy

22. If number of vibrations of a string are to be increased by factor of two, then tension in the string (a) Half (b) 16 times

(c) Two times

23. A pipe 30 cm long is open at both ends. Which harmonic mode of the pipe is resonantly excited

(a) First

(b) Second

(c) Third

(d) Fourth

24. The Doppler's effect is applicable for:

(a) Light waves

(b) Sound waves

(c) Radio waves

25. When sound wave enter from a rare medium to denser medium then which of the following

(a) Speed increases

(b) Wavelength increases

(c) Frequency increases

(d) All of these

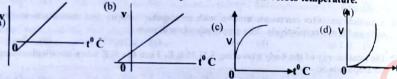

26. With increase in humidity in air the speed of sound in air is:

(a) Increase

(b) Decrease

(c) Remains same

27. Which of the following graph is correct for speed of sound in air verses temperature.

28. If the distance between two consecutive nodes is one fourth of length 'l' of the string then the wavelength of the wave will be:

(b) £/2

(c) 2e

29. A stretched string of length 'l', fixed at both ends can sustain stationary waves of wavelength \( \lambda \). given by:

(a)  $\lambda = n^2/n\ell$  (b)  $\lambda = \ell^2/2n$  (c)  $\lambda = 2\ell/n$  (d)  $\lambda = 2\ell n$ 

30. A source of sound emits wave with frequency f Hz and speed v m/sec. Two observers moves away from this source in opposite direction with a speed of 0.2 v relative to the source. The ratio of frequencies heard by the two observers will be:

(a) 3:2

(b) 2:3

(c) 1:1

(d) 4:10

31. An observer is moving away from source of sound of frequency 200 Hz. His speed is 33 m/s speed of sound is 330 m/s, observed frequency is:

(a) 90 Hz

(b) 180 Hz

92 Hz

(d) 184 Hz

32. Which of the following is not an assumption of the kinetic model of an ideal gas? unit 5

(a) The size of the molecules is much smaller than the separation between molecules. Molecules suffer negligible momentum change during wall collisions

(c) Molecules do not exert force on each other except during a collision

The gas molecules are in random motion and may change their direction of motion after every collision

#### **OSCILLATIONS & WAVES**

Zavan Publishe

- The distance between two consecutive nodes in a stationary wave is equal to:

(a) One wavelength

- (d) Half wavelength
- (c) 3 wavelength 10. When a wave comes across the boundary of two media, a part of it is reflected back. Which statement is true about reflected wave:
  - (a) Its wavelength changes depending on the nature of the boundary
  - Its frequency changes depending on the nature of the boundary
  - Its amplitude increases depending on the nature of the boundary
  - Its phase may changes depending on the nature of the boundary
- 11. A vibrating string have a little sound. However, when attached with a board then sound have a greater intensity. It is because:
  - (a) The string vibrates with more energy
  - (b) The sound is concentrated over smaller area
  - (c) The speed of sound is greater in board

  - (d) The energy leaves the board at a greater rate
- 12. The two points of a medium are separated through a distance of 10cm. What is the phase angle between these two points if the wavelength of the wave is 0.1m.
  - (a) T
- (b) 2π
- (c) 3m
- 13. When a standing wave is set up in a pipe which is open from one end, which of the following statement is true?
  - (a) Sum of the number of antinodes and the number of nodes is always even
  - (b) Wavelength = length string / number of nodes
  - The shape of the string at any instant shows a symmetry about the midpoint of the
  - (d) Frequency = number of nodes × fundamental frequency
- 14. Frequency of a travelling wave is 2000 Hz. Its speed is 300 m/s. What is its wavelength?
  - (a) 20/3 m
- (b)  $20 \times 3 \, \text{m}$
- (c) 3/20 m
  - (d) 2/3 m
- 15. The speed v of the waves in the string depends upon the tension F of the string and m, the mass per unit length of the string. It is given by (a)  $v^2 = F/m$ (b) v = F/m(c) vxm = F(d)  $v = F \times m$
- 16. At what speed should a source of sound move away from the source so that stationary observer
  - (b) 2v
  - finds the apparent frequency equal to half of the original frequency:
- 17. The source is moving away from a stationary observer then the pitch of the sound will:
  - (a) Decrease (b) Increase
- (c) Remains same (d) Cannot be predicted
- 18. Doppler shift in frequencies does not depend upon:
  - (a) The frequency of the wave produced
- (b) The velocity of the source
- (c) The velocity of the observer
- (d) None of the above
- 19. The fundamental frequency of a closed organ pipe is 100 Hz. The frequency of the second overtone is: (a) 100 Hz (b) 200 Hz (c) 300 Hz (d) 500 Hz 20. If two waves having amplitude 2 cm and 3 cm interfere with each other then the ratio between

- maximum and minimum intensities will be: (a) 3:2 (b) 5:1
- 21. Speed of sound at temperature 10°C is about:
- (c) 25:1 (d) 1:25

d

- (a) 332 m/s (b) 338 m/s 22. Speed of sound in air is 332 m/s at temperature:
  - (a) Zero kelvin
- (b) 273 k
- (c) 373 k

(c) 342 m/s

(d) 348 m/s (d) Room temperature

12. 13. 14. 15. 16. 17. 18. 19. 20. 21. 22. d

(d) T/9

(d) π

23. When frequency of sound is 400 Hz. The speed of sound in air is v. What is speed of sound in air if frequency is 800 Hz:

(c) 2v (a) v (b) v/2

24. With which velocity an observer should move relative to a stationary source so that he hears a

(a) Velocity of sound towards the source

(b) Velocity of sound away from the source

(c) Half the velocity of sound towards the source

(d) Double the velocity of sound towards the source

25. If the velocity of sound in air is 350 m/s. Then the fundamental frequency of an open pipe of

(a) 350 Hz

(b) 175 Hz

(c) 900 Hz

(d) 750 Hz

26. A stretched string of 1m length and mass 5 x10⁻⁴ kg is having tension of 20N. If it is plucked at 25 cm from one end then it will vibrate with frequency:

(a) 100 Hz

(b) 200 Hz

(c) 300 Hz

(d) 400 Hz 27. When two sound waves superpose, beats are produced when they have:

(a) Different amplitudes and phases (b) Different velocities

(c) Different phases

(d) Different frequencies

28. The superposition takes place between two waves of frequency 'f' and amplitude 'a'. The total intensity is directly proportional to:

(a) a

(b) a²

(c)  $\sqrt{a}$  (d)  $1/\sqrt{a}$ 

29. Which of the following is not the transverse wave?

(a) X-rays

(b) γ-rays (c) Visible light

(d) Sound waves

30. An observer moves towards a stationary source of sound, with a velocity one-fifth of the velocity of sound. What is the percentage increase in the apparent frequency:

31. Velocity of sound is maximum in:

(b) 20% (c) Zero (d) 0.5%

(a) Air (b) Vaccum (c) Water 32. To make the frequency double of a spring oscillator, we have to:

(a) Reduce the mass to one fourth (b) Quadruple the mass

(c) Double of mass (d) Half of mass 33. In a second pendulum, mass of bob is 30 gm. If it is replaced by 90 gm mass. Then its time period

(a) 1 s

(d) 3 s

(c) 4s 34. The time period of simple pendulum is 2s. If its length is increased 4 times, then its period

(d) 4 sec

(a) 16s (b) 2s (c) 8s

(a) Parabola

(b) Hyperbola

35. The graph between T.E and displacement of a particle executing SHM is: (c) Straight line

(d) Ellipse

36. The K.E and P.E of a particle executing S.H.M will be equal, when displacement is:

(a)  $x_0/2$ 

(b)  $x_0\sqrt{2}$ 

(c)  $x\sqrt{\sqrt{2}}$ 

(d)  $x_0\sqrt{2}/3$ 

37. A small body of mass 0.10 kg is executing S.H.M of amplitude 1.0 m and period 0.20 s. The maximum force acting on it is:

(a) 98.596 N

(b) 100.2 N

(c) 76.23 N

(d) 985.96 N

38. A particle is executing a motion x=A  $\cos(\omega t - \theta)$ . The maximum velocity of the particle is:

(a)  $A \omega \cos \theta$ 

(b) A ω

(c)  $A \omega \sin \theta$ 

(d) None of these

**OSCILLATIONS & WAVES** 

40. A loaded spring vibrates with a period T. The spring is divided into nine equal parts and the

42. A particle of mass m oscillates with simple harmonic motion between points  $x_1$  and  $x_2$ , the equilibrium position being O. Its potential energy is plotted. It will be as given below in the

(b) 3 T (c) T/3

The projection of the particle is executing non-periodic motion The projection of the particle on any of the diameter executes S.H.M

same load is suspended from one of these parts. The new period is:

41. What is the phase difference between velocity and displacement is SHM?

43. A pendulum suspended from the ceiling of a train has a period T when the train is at rest, When the train is accelerating with a uniform acceleration, the period of oscillation will be:

(a) Increases

graph:

(b) decreases

(c) Remain unaffected

the following statement is true:

(d) None of the above

The particle so moving executes S.H.M.

(d) Become infinite

44. A seconds' pendulum is placed in a space laboratory orbiting around the Earth at a height 3R, where R is the radius of the Earth. The time period of the pendulum is:

(a) Infinite

(b) 4 s

(c) Zero

(d)  $2\sqrt{3} s$ .

45. The of equation of SHM of a particle is  $a = 4\pi^2 x$  where a is instantaneous linear acceleration at displacement x. The frequency of motion is:

(a) 1 Hz

(b) 4π Hz

(c)  $\frac{1}{4}$  Hz

(d) 4 Hz

46. A body of mass M is suspended from a spring of force constant K and mass m. The time period of vertical oscillations is

(a)  $2\pi \sqrt{\frac{M}{K}}$  (b)  $2\pi \sqrt{\frac{m}{K}}$  (c)  $2\pi \sqrt{\frac{M+m}{K}}$  (d)  $2\pi \sqrt{\frac{M+m/3}{K}}$

47. The length of the seconds' pendulum on the surface of Earth is 1 m. Its length on the surface of Moon, where g is  $\frac{1}{6}th$  the value of g on the surface of Earth, is

(a)  $\frac{1}{6}m$  (b) 6m (c)  $\frac{1}{26}m$ 

48. The length of simple pendulum is increased by 1%. Its time period will be:

(a) Increase by 1% (b) Decrease by 0.5%

(c) Increase by 0.5% (d) Increase by 2%

49. At what temperature velocity of sound is double then that of at 0°C:

(a) 819 K

(b) 819°C

(c) 600°C

50. Two tuning forks have frequencies 450 Hz and 454 Hz respectively. On sounding these forks together, the time interval between successive maximum intensities will be:

(a) 1/4 sec

(b) 1/2 sec

(c) 4 sec

(d) 2 sec

## PRACTICE TEST NO. 5

1. A particle is executing SHM. Which of the following is maximum when the bob is at the mean position?

(a) Time period

(b) Amplitude

(c) Velocity

(d) Acceleration

2. A simple pendulum has a period T. What will be the percentage change in period if the amplitude is decreased by 6%?

(a) 6%

(b) 3%

(c) 1.5%

(d) No change

3. If acceleration due to gravity is halved, then the frequency f of oscillation of a spring becomes:

(b) 4f (c)  $\frac{f}{2}$ 

(d) No effect

4. A uniform spring of force constant k is cut into two pieces, the lengths of which are in the ratio 1 : 2. The ratio of the force constants of the shorter and the longer pieces is:

(a) 1:2 (b) 2:3 (c) 2:1 (d) 1:3

5. The potential energy of a body executing SHM will be maximum at:

(a) Equilibrium position

(b) Extreme position

(c) Both at equilibrium and extreme position

(d) Midway between equilibrium and extreme position

6. The length of a simple pendulum executing simple harmonic motion is increased by 21%. The percentage increase in the time period of the pendulum of increased length is:

(a) 10% (b) 15% (c) 21% (d) 42% 7. The time period of a simple pendulum measured inside a stationary lift is T. If the lift starts moving upward with an acceleration of g/3, what will be its time period?

### **OSCILLATIONS & WAVES**

8. A simple harmonic oscillator has a period of 0.02 s and an amplitude of 0.05 m. Its velocity at the mean position is: (a)  $2\pi m s^{-1}$ (b)  $3\pi m s^{-1}$  (c)  $4\pi m s^{-1}$ 

9. A S.H.M has amplitude 'a' and time period 'T'. The maximum velocity will be:

(a) 4a/T

(b) 2a/T

(c)  $2\pi \sqrt{a/T}$ 

(d) 2πa/T

10. For a particle executing simple harmonic motion, Which of the following statement is not

Total energy of the particle always remains the same

Restoring force always directed towards the fixed point

(c) Restoring force is maximum at extreme position

(d) Acceleration of particle is maximum at equilibrium position

11. The total energy of a particle executing S.H.M is proportional to:

(a) Displacement from equilibrium position (b) Frequency of oscillation

(c) Velocity in equilibrium position

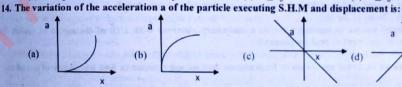

(d) Square of amplitude of motion

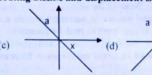

12. A particle is executing simple harmonic motion with frequency f. the frequency at which its K.E. change into P.E is: (a) f/2 (b) F

(c) 2f (d) 4 f

13. Displacement between maximum P.E position and maximum K.E position for a particle executing S.H.M is:

(a)  $-x_0$  (b)  $+x_0$  (c)  $\pm x_0$ 

15. The vertical extension in a light spring by a weight of 1kg suspended from the wire is 9.8 cm. The period oscillation:

(a)  $20 \pi \sec$  (b)  $2 \pi \sec$ 

(c)  $2 \pi/10 \text{ sec}$ 

(d)  $200 \pi \sec$ 

16. The relation between phase difference  $\Delta \emptyset$  and path difference  $\Delta x$  is given as: (a)  $\Delta \Phi = 2\pi (\Delta x)/\lambda$  (b)  $\Delta \Phi = 2\pi \lambda \Delta x$ 

(c)  $\Delta \Phi = 2\pi \lambda / \Delta x$ 

(d)  $\Delta \Phi = 2\Delta x/\lambda$ 

17. If sound wave of frequency f is travelling in air with speed v then sound wave of frequency 4f will travel with speed. (a) v

direction of wave motion of waves is known as:

(b) 4v

(c) 2v

(d) v/4 18. The waves in which the particles of the medium vibrate in a direction perpendicular to the

(a) Transverse wave (c) Propagated wave

(b) Longitudinal wave (d) None of these

19. If the phase difference between the two waves is  $2\pi$  during superposition, then the resultant amplitude is:

(a) Maximum

(c) Maximum or minimum

(b) Minimum

(d) Neither maximum nor minimum

20. An observer is moving away from source of sound of frequency 100 Hz. His speed is 33m/s. If speed of sound is 330 m/s, then the observed frequency is:

| (a) 90   | Hz    |    | (b   | ) 10  | 0 Hz |     | (c  | 91  | Hz   |      | (d   | ) 110 | ) Hz  |        |

51. The distance moved by a particle in simple harmonic motion in one time period is:

(a) A

(b) 2A

(c) 4A

52. A pendulum clock keeping correct time is taken to high altitudes.

(a) It will keep correct time.

(b) Its length should be increased to keep correct time.

(c) Its length should be decreased to keep correct time.

(d) It cannot keep correct time even if the length is changed.

53. The bob of a simple pendulum is kept oscillating by the

(a) Gravitational force

(b) Electrical force (c) Magnetic force (d) Viscous force

54. The time period of a mass suspended from a spring is T. If the spring is cut into four equal parts and the same mass is suspended from one of the parts, then the new time period will be:

55. What fraction of the total energy is kinetic when the displacement is one-half of the amplitude?

56. The length of a seconds' pendulum is approximately:

(a) 994 mm

(b) 99.3 mm

(c) 993 cm

(d) 9.93 m

57. A simple harmonic oscillator has an amplitude 'a' and time period 'T'. The time required by it to travel from x=0 to x=a/2 is:

(a) T/6

(b) T/3

(c) T/4

(d) T/12

58. A particle is performing simple harmonic motion with amplitude A and angular velocity  $\omega$ . The ratio of maximum velocity to maximum acceleration is:

(b) 1/ω

(c) 2ω

59. The amplitude of a particle executing S.H.M with frequency of 60 Hz is 0.01 m. The maximum value of acceleration of the particle is:

(a)  $144\pi^2 \text{ m/s}^2$ 

(d)  $288\pi^2 \text{ m/sec}^2$ 

(b)  $144\pi$  m/s (c)  $144/\pi^2$  m/s² 60. A particle executes S.H.M along a straight line with an amplitude A. The P.E is maximum when the displacement is:

(a) +A

(b)  $\pm A/2$ 

(c) Zero (d)  $\pm A/\sqrt{2}$

PRACTICE TEST NO. 6

OSCILLATIONS & WAVES

The time period of simple pendulum when it is made to oscillate on the surface of moon:

(a) Increases

(b) Decreases

unchanged

(d) Becomes infinite

A uniform spring of force constant k is cut into two pieces, the lengths of which are in the ratio 1.2. The ratio of the force constants of the shorter and the longer pieces is:

(a) 1:3

(b) 1:2

(c) 2:3

(d) 2:1

(a) 2:1
3. Figure shows transverse wave of frequency 100 Hz travelling in stretched string then speed of the

(a) 5 m/s

(b) 10 m/s

(c) 15 m/s

(d) 20 m/s

4 If the temperature of the atmosphere is increased then which of the following character of the sound wave is affected:

(a) Amplitude

(b) Frequency

(c) Velocity

5. The beats are produced by two sound sources of same amplitude and for nearly equal frequencies. The maximum intensity of beats will be ...... that of one source:

(a) Same

(b) Double

(c) Four times

(d) Eight times

6. A string of length & is fixed at both ends is vibrating in two segments. The wave length of the

corresponding wave is:

(a) 1/4

(b) 2/2

(c) e

(d) 28

7. A closed pipe and an open pipe have their first overtones identical in frequency. Their length are in the ratio:

(a) 1:2

(b) 2:3

(c) 3:4

(c) 10 m/s

(d) 4:5

8. An observer is moving towards the stationary source of sound, then:

(a) Apparent frequency will be less than the real frequency

(b) Apparent frequency will be greater than the real frequency

(c) Apparent frequency will be equal to real frequency

(d) The quality of sound will change

9. A string is attached with a vibrator having frequency 100 Hz. If the distance between two consecutive crest is 2 cm then speed of the wave is: (a) 1 m/s

(b) 2 m/s 10. According to Newton, Modulus of elasticity of air is:

(a)  $1 \times 10^2 \text{ Pa}$ (b)  $1.4 \times 10^5 \text{ Pa}$ 

(c) 1 x 10⁵ Pa

(d) 20 m/s (d) zero

11. With two degree rise in temperature the speed of sound in air increases by:

12. When two tuning forks are sounded together the beat frequency is 3 Hz. If one tuning fork has frequency 480 Hz the frequency of other tuning fork may be: (a) 477 Hz 13. A 16cm string is vibrating in four segments with frequency 100 Hz then the frequency of third

(a) 0.61 m/s

(b) 1.2 m/s

(a) 25 Hz

14. The fundamental note produced by a closed organ pipe is of frequency 'f'. The fundamental note produced by an open organ pipe of same length will be of frequency:

| 1 2         | (0) | •  |    |    | (c) | 21 |     |     | (d) · | 41  |     |
|-------------|-----|----|----|----|-----|----|-----|-----|-------|-----|-----|
| ns: a 4. 3. | 4.  | 5. | 6. | 7. | 8.  | 9. | 10. | 11. | 12.   | 13. | 14. |
| a d d       | c   | С  | c  | С  | b   | b  | c   | b   | d     | Ь   | c   |

15. A source emits a sound of wavelength 30 cm, but the listener observes wavelength 32 cm. Then,

- (a) Listener is moving towards the source
- (b) Listener is moving away from source
- (c) Source is moving towards the listener
- (d) Source is moving away from listener
- 16. When a source moves towards a stationary observer then we use relation to find frequency of

(a)  $f' = \left(\frac{v}{v + u_s}\right)f$  (b)  $f' = \left(\frac{v}{v - u_s}\right)f$  (c)  $f' = \left(\frac{v + u_s}{v}\right)f$  (d)  $f' = \left(\frac{v - u_s}{v}\right)f$ 

- 17. Ten complete waves pass through a point in 2 seconds. If the wavelength is 20 cm, what is the speed of the wave?
- (a) 1 m/s
- (b) 10 cm/s
- (c) 2 m/s
- (d) 40 cm/s
- 18. Which of the following frequency of sound wave is not audible?
  - (a) 5 Hz
- (b) 5000 Hz (c) 2500 Hz
- (d) 50 kHz
- 19. Acceleration in the simple pendulum is always to displacement.
  - Inversely proportional
    - (b) Directly proportional (c) Acting negative (d) Independent
- 20. An object undergoes simple harmonic motion, its amplitude is xo. The speed of the object is v when its displacement is  $x_0/3$ . What is the speed when its displacement is  $x_0$ ?
- (b) 3/2v (c) 2v (d) 0
- 21. Two travelling waves of the same frequency, same amplitude and travelling in same direction result in:
- (b) Standing waves (c) Diffraction (d) Interference 22. Two waves interfere constructively, if the path difference between them must be:
- (a) Beats (a)  $(2n+1)\lambda$
- (b)  $(2n+1)\lambda/2$  (c)  $(2n+1)\lambda/3$
- 23. Which of the following statements about wave motion is true:
- - (a) Waves transport energy and matter
  - (b) Waves transport energy without transporting matter
  - (c) Waves transport matter but not energy
  - (d) None of these
- 24. A pipe is open at both ends. A stationary wave is formed in the air of the pipe. Which statement is true:
  - (a) There is always a central anti node
  - (b) There is always a central node
  - (c) The sum of number of nodes and the number of antinodes is always an even number
- (d) The sum of number of nodes and the number of antinodes is always an odd number 25. When path difference between two waves are odd integral multiple of half the wavelength, the resultant effect is called:
  - (a) Destructive interference

(b) Constructive interference

- (d) Diffraction
- 26. A wave have the speed of 0.50 m/s. If its wavelength is 1.5 m. What is the period of the wave?
  - (a) 0.33s
- (b) 3s
- (c) 1.5s

- 27. In stationary waves
  - (a) Strain is maximum at antinodes
  - (b) Strain is minimum at nodes
  - (c) Strain is maximum at node
  - (d) Amplitude is same at all points
- 15. 16. 17. 19. c d

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

- 28. In a travelling wave, five complete waves passes through a points in 10 seconds. Frequency of the
- (a) 0.5 Hz (b) 5 Hz 29. The distance between the consecutive wave fronts is equal to:
- (c) 50 Hz
  - (a) One wavelength

**OSCILLATIONS & WAVES** 

- (b) Two wavelengths (d) Diameter
- (c) Radius
- 30. A stationary wave is set up in a pipe of length L, which is open from one end. There are three nodes. How many antinodes are there in the stationary wave?
  - (b) 3
- (c) 4
- 31. A simple pendulum has mass M, length L and time period T. What is the period of oscillation of the pendulum with mass 4M and length 36L?
  - (a) 6T (b) T
- (c) 2T

(d) 15 Hz

12. A simple pendulum length 'L' with bob of mass 'm' is slightly displaced from its mean nosition so that it string makes an angle ' $\theta$ ' with vertical line as shown in the figure. Then bob of pendulum released. What will be the expression of torque with which the hob starts to move towards the mean position?

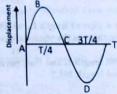

- (a) mgL sin $\theta$
- (c) 0
- (d) mgL  $\cos\theta$
- 33. Ratio of moment of inertia of two objects 'A' and 'B' is 2:3. Which one of the following is the ratio of torques of 'A' And 'B' respectively, if both are being rotated with constant angular acceleration?
  - (a) 3:4
- (b) 3:2
- (c) 2:3
- (d) 4:3
- 34. For interference of light waves to take place, the required condition is
  - (a) The path difference of the light waves from the two source must be large
  - (b) The interfering waves must be non-coherent
  - (c) The light waves may come from different sources
  - (d) The light waves may come from two coherent sources
- 35. The property of bending of light around an obstacle and spreading of light waves into geometric shadow of an obstacle is called:
  - (a) Diffraction
  - (c) Quantization of Light

- (b) Polarization (d) Interference of light
- 36. For constructive interference the path difference is:

  - (a)  $\left(n + \frac{1}{2}\right)\lambda$  where n = 0, 1, 2, ... (b)  $n\lambda$  where n = 0, 1, 2, ... (c)  $(2n + 1)\lambda$  where n = 0, 1, 2, ... (d)  $\left(\frac{n+1}{2}\right)\lambda$  where n = 0, 1, 2, ...
- 37. A source of sound wave emits waves of frequency 'f'. If 'v' is speed of sound waves, then what will be the wavelength of the waves:
  - (b)  $v-u_0$ 
    - (c) vf
- 38. The spectrum of a star's light is measured and the wavelength of one of the lines as the sodium's line is found to be 589 nm. The same line has the wavelength of 497 nm when observed in the laboratory. This means the star is:\
  - (a) Moving away from the earth (c) Stationary
- (b) Moving towards the north (d) Revolving around the planet

- 39. What is the period of mass spring system during SHM if the ratio of mass to spring constant is
  - (a) π
- (b) 1/π
- (c)  $2\pi$
- (d) ½π
- 40. Waveform of SHM is given in figure. At what time/times displacement is equal to zero?

- (a) T/4 only
- (b) 3T/4 only (c) 0, T/4, 3T/4 and T
- 41. A simple harmonic oscillator has a time period of 1 seconds. Which equation relates its acceleration 'a' and displacement 'x'?
  - (a) a = -2x
- (b)  $a = -(2\pi)x$
- (c)  $a = -\left(\frac{2\pi}{10}\right)^2 x$  (d)  $a = -(2\pi)^2 x$
- 42. When the length of simple pendulum is doubled, find the ratio of the new frequency to the old frequency?
  - (a) 1/4
- (b)  $\sqrt{2}$
- (c) ½
- 43. In the diagram below, the displacement of an oscillating particle is plotted against time, What does the length 'PR' on the time axis represents?

(a) Twice the frequency (c) Half the frequency

- (b) Half the period
- (d) Twice the period
- 44. When the source of sound moves towards the stationary observer, the value of apparent frequency 'fo' is:

- (a)  $f_0 = \left(\frac{v + u_0}{v}\right) f$  (b)  $f_0 = \left(\frac{v}{v + u_s}\right) f$  (c)  $f_0 = \left(\frac{v}{v u_s}\right) f$  (d)  $f_0 = \left(\frac{v u_0}{v}\right) f$ 45. For vibrating mass-spring system, the expression of kinetic energy at any displacement 'x' is
  - (a)  $\frac{1}{2}kx_0^2\left(1-\frac{x^2}{x^2}\right)$

(c)  $\frac{1}{2} m\omega \left(1 - \frac{x^2}{2}\right)$ 

- 46. Speed of sound through a gas in measured as 340 m/s at pressure P1 and temperature T1. What will be the speed of sound if pressure of gas is doubled but temperature is kept constant?
- (b) 340 m/s
- (c) 170 m/s
- (d) 680 m/s
- 47. What should be the length of simple pendulum whose period is 6.28 second at a place where g = 10 ms-2.
  - (a) 0.28 m
- (b) 6.28 m
- (c) 10.8 m
- (d) 10 m
- 48. What should be the ratio of kinetic energy to total energy for simple harmonic oscillator?

- OSCILLATIONS & WAVES
- 49. In a simple harmonic motion with a radius 'x₀', the velocity of the particle at any point is:
- (a)  $v = \omega \sqrt{x_0^2 x^2}$

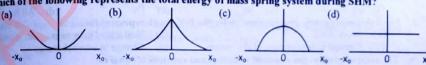

(b)  $v = \omega(x^2 - x_0^2)$ (d)  $v = \omega \sqrt{(x - x_0)}$ 

- (c)  $v = \omega(\sqrt{x_0 x})$
- 50. Frequency of simple pendulum of length 9.6 m will be:
  - (c)  $\pi/2$  Hertz (d)  $\pi/4$  Hertz
- (a) 2π Hertz 51. A body performs simple harmonic motion with a period of 0.063 s. The maximum speed of 3.0 A pour has are the values of the amplitude 'x₀(m)' and angular frequency 'ω (rads⁻¹)'?
  - (a)  $x_0 = 0.03$ ,  $\omega = 100$

- (b)  $x_0 = 0.19, \omega = 16$
- (d)  $x_0 = 3.3$ ,  $\omega = 100$
- (c)  $x_0 = 5.3$ ,  $\omega = 16$ 52. Food being cooked in microwave oven is an example of:
  - (b) Overtones
- (c) Resonance (d) Stationary waves
- (a) Beats 53. Potential energy of a mass spring system with respect to displacement during simple harmonic motion (SHM) is shown in the figure.

Which of the following represents the total energy of mass spring system during SHM?

- 54. Mathematical formula of maximum velocity (vo) for a body executing simple harmonic motion is:
  - (a)  $v_0 = \omega x_0$

(b)  $v_0 = \frac{k}{m} \sqrt{x_0^2 - x^2}$ 

 $v_0 = v \sqrt{1 - \frac{x^2}{x_0^2}}$ 

- (d)  $v_0 = m_0 \sqrt{x_0^2 x^2}$
- 55. An observer moves with velocity 'vo' towards a stationary source, then the number of waves received in one second is:
- (b)  $f = f\left(\frac{v}{v v_o}\right)$  (c)  $f = f\left(\frac{v + v_o}{v}\right)$  (d)  $f = f\left(\frac{v v_o}{v}\right)$

- 56. Resonance occurs when the driving frequency is:
  - (a) Greater than natural frequency
- (b) Unequal the natural frequency
- (c) Less than natural frequency
- (d) Equal to the natural frequency 57. The red shift measurement of Doppler effect of galaxies indicate that the universe is:
  - (a) Expanding (b) Contracting (c) Stationary
- 58. Frequency audible range to human hearing lies in the range: (a) 2-2000 kHz
  - (b) 15-50000 kHz
- (c) 20-20000 kHz
- (d) 20-20000 kHz

## UNIT $05 \rangle$

# **HEAT AND** THERMODYNAMICS

### PRACTICE TEST NO. 1

1. A gas changes its state from A to B along different path then which of the following relation is true about change in internal energies:

(a)  $\Delta U_1 = \Delta U_2$ 

 $\Delta U_1 > \Delta U_2$ 

2. At room temperature which of the following gas molecules have greater average K.E.

(a) H₂

(b) No

(d) All have same

3. For a thermodynamic process area under the P-V graph represent the:

(a) Work done

(b) Heat added to system

(c) Change in temperature of the system

(d) Change in internal energy

4. The ratio of general gas constant to Boltzmann constant is equal to:

(a)  $8.314 \text{ J mol}^{-1} \text{ K}^{-1}$  (b)  $6.02 \times 1023 \text{ mol}^{-1}$  (c)  $1.38 \times 10-23 \text{ JK}^{-1}$  (d) One

5. P-V diagram for a cyclic process is shown in the figure below, then work done will be:

(a) PV

(b) 4PV

(c) 9PV

(d) Zero

6. 2PV = RT is ideal equation for:

(a) 1 mole

(b) 2 moles

(c) 0.5 moles

(d) 0.25 moles

7. 1st law of thermodynamics is modified form of law of conservation of:

(b) Energy

(d) All of these (c) Momentum

8. According to 1st law of thermodynamics change in internal energy of the system is given as: (a) Q + W(d) Q (b) Q-W (c) W-O

9. If a gas undergoes a cyclic process the its change in internal energy will be zero:

(a) Positive

(b) Negative

(c) Zero

(d) Area of the cycle

10. For which of the following process heat energy is entirely converted into mechanical energy:

(a) Isothermal expansion

(b) Adiabatic expansion

(c) Isothermal compression

(d) Adiabatic compression

11. In which of the following process mechanical energy is entirely converted into internal energy?

(a) Isothermal expansion

(b) Adiabatic expansion

(c) Isothermal compression

HEAT AND THERMODYNAMICS

Zayan Publishe

12. It's kg and 10 kg water are heated then the ratio between their heat capacity will be:

(d) Negative

(c) 1:

13. The ratio of unit of specific heat to unit of heat capacity is:

(d) K-

14. Specific heat of an idea gas for an adiabatic process is:

15. For an ideal gas if  $C_v = \frac{3}{2} R$  then  $C_p = ?$ 

(b) 3R/2

(d) 7R/2

16. For an ideal gas the ratio C,/C, is always:

(a) Equal to one (b) Less than one

Equal or less

Equal or greater

17. A fixed mass of an ideal gas is contained in a cylinder at constant temperature. Now the pressure of the gas is decreased. What happened to the molecules of gas?

Their mean square speed decreases

Number of collision between molecules and walls of container decreased

The force of attraction between them increase

Its internal energy decreases

18 If N is the number of molecules of a gas in a container. Then number of moles can be calculated as:

(a) N+N

(b)  $N_A \times N$ 

(d)  $N - N_A$ 

19. A liquid has mass m and specific heat capacity c. The rate of change in temperature of liquid is R. What is the rate at which heat is transferred from the liquid.

(a) Rmc

(b) R + mc

(c) mc-R

20. Which statement is incorrect?

(a) In a isobaric process  $\Delta P = 0$ 

(b) In a isochoric process  $\Delta W = 0$ 

(c) In a isothermal process  $\Delta T = 0$ 

(d) In a isothermal process  $\Delta Q = 0$ 

21. In adiabatic expansion (a)  $\Delta U = 0$ 

(b)  $\Delta U = \text{negative}$ 22. An ideal reversible heat engine is 100% efficient only if:

(c)  $\Delta U = positive$ 

(b) Hot reservoir is at 0C (d) Cold reservoir is at 0k

(c) Cold reservoir is at 0C 23. An adiabatic change is the one in which:

(a) No heat is added to or taken out of a system

(b) No change of temperature takes place

(c) Boyle's law is applicable

(a) Hot reservoir is at 0K

(d) Pressure and volume remains constant

24. A thermodynamic system undergoes a process in which its internal energy decreases by 300 J. If at the same time 120 J of work is done on the system, find the heat lost by the system.

(b) 80J

25. The efficiency of Carnot engine can never be 1, because: (c) 420J

(a) We cannot achieve the higher temperature (b) We do not have an ideal working substance

There is always energy losses

We need cold reservoir at absolute zero temperature, which is not available

| Sr. 12.<br>Ans: a |     |     |     |     |     |     |     |     |     |     |

temperature of gas in X:

(b) is double of

(b) 1J

40. During adiabatic expansion internal energy decreases by 2J, then work done in this process is:

(c) -IJ 41. The engine is supposed to work between 727 degree C and 227 degree C, then maximum possible

(c) is half of

(a) is equal to

efficiency is

(a) 1/2

MDCAT PREP BOOF

HEAT AND THERMODYNAMICS When heat is given to isobaric process then: Zayan Publishe (a) Work is done by the gas (b) Internal energy of gas decrease (c) Work is done on the gas (d) Both a and b 43. The efficiency of diesel engine is: (a) 10% to 20% (b) 20% to 35% (c) 35% to 40% (d) 40% to 50% 44. According to 1st law of thermodynamics, when heat is added to a system it appears as: (a) Increase in internal energy Work done by the system Either increase in internal energy or work done by the system (b) (d) Increase in internal energy plus work done by the system 45. For mono atomic ideal gas  $C_v = ?$ (a) 3R/2 (c) 7R/2 46. What does the constant N represent in the equation of state for an ideal gas PV=NkT? (a) Number of molecules of gas (b) Number of moles of the gas (c) Number of nucleons (d) Measuring a voltage 47. An ideal reversible heat engine has: (a) 1 efficiency (b) Highest efficiency (c) An efficiency which depends on the nature substance (d) None of these 48, 100 W heater is used for 5 minutes to heat 500 g of water. What is the change in temperature of water? Specific heat capacity of water is 4.2J/gC. (a) 140C (b) 40C (c) 0.2C (d) 14C 49. Work done in a isobaric process is given by: (a) PdT (b) VdP (d) P²Dv (c) PdV 50. A gas is compressed to half of its initial volume at constant pressure 105 Pa. If its initial volume is 1000 cm3 then work done is:

#### 43. 44 45. 46. 47. 48. 49.

(c) 200J

(d) -50 J

## PRACTICE TEST NO. 2

(b) 100 J

(a) 50J

Ans:

(d) is one fourth of

(d) 1

| 303                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                 | By AZHAR IQ                | BAL 0336-7098894                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |  |  |  |  |  |  |  |

- 34. If root mean square velocity of a gas at temperature 27°C is v. Then root mean square velocity of gas at temperature 327°C will be:
- (b) 2v
- (c)  $\sqrt{2} v$
- 35. If helium gas is enclosed in a cylinder then molecules will have?
  - (a) Translational K.E. (c) Vibrational K.E.

- (b) Rotational K.E. (d) All of these
- 36. Internal energy of an ideal gas at temperature T is U, then is internal energy at temperature 4T will be:
  - (a) U
- (b) 2U
- (c) U/2

37. In which of the following graph work done is zero.

(d) None of these

- 38. General gas constant have same units as that of:
  - (a) Boltzmann constant
- (c) Molar specific heat

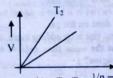

- (d) Internal energy
- 39. If 50 J work is done on the system and at same time 100 J heat is added to the system, then change in internal energy of the system will be:
  - (a) 50 J
- (b) 150 J
- (c) -50 J
- (d) -150 J

(d) Isochoric

- 40. For which of the following process then its change in internal energy will be:
  - (a) Isothermal (b) Adiabatic
- 41. Heating food in pressure cooker is an example of: (a) Isothermal process
- (c) Isobaric
  - (b) Adiabatic process

(c) Isobaric process

- (d) Isochoric process
- 42. If two different gases undergo isothermal expansion at temperature T1 an T2 as shown in the figure below then:

- (a)  $T_1 = T_2$

- Cannot be determined
- 43. When water is heated isothermally, then its heat capacity will be:
- (b) Infinite
- (c) 4.18 JK
- (d) 4180 JK-1
- 44. The difference between molar specific heat of a gas at constant pressure and molar specific heat at constant volume is: (in SI units)
  - (a) 1.38x10⁻²³
- (b) 8.314
- (c)  $6.02 \times 10^{23}$  . (d) Zero
- 45. If γ is ratio of molar specific heat of a gas at constant pressure to molar specific heat of gas at constant volume and R is general gas constant then which of the following relation is true?

- $C_p C_v = R$  (d) All of these
- 46. If 100 J work is done on the system during an adiabatic compression then heat added to system

which of the following graph represents the relationship between average K.E of a gas and

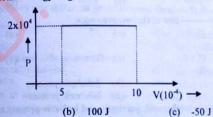

49. Unit of general gas constant in terms of base units is:

- (a) Kgms⁻² mol⁻¹K⁻¹ (b) Kgm²s⁻²mol k⁻¹
- (c)  $Kgm^2s^{-3}mol^{-1}k^{-1}$  (d)  $Kgm^2s^{-2}mol^{-1}k^{-1}$

(d) 150 J

50. When 50 J heat is added to a gas it undergoes an expansion as shown in the figure below, then the change in internal energy of gas will be:

| Sr.  | 47. | 48. | 49. |
|------|-----|-----|-----|
| Ans: | a   | a   | С   |

### PRACTICE TEST NO. 3

- 1. Which of the following is not a state function?
  - (a) Work done
- (b) Internal energy (c) Gravitational P.E (d) None of these
- 2. A gas undergoes an expansion then which of the following is correct statement:
  - (a) Work is done on the system and it is taken as -ve
  - (b) Work is done by the system and it is taken as -ve
  - (c) Work is done on the system and it is taken as +ve
  - (d) Work is done by the system and it is taken as +ve
- 3. Unit of Boltzmann constant is same as that of:
  - (a) Specific heat
- (b) Heat capacity
- Temperature (c) coefficient of resistance
- (d) Decay constant

- 4. Root mean square velocity of a gas is given as:

(c) W = 0

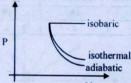

- All of these
- 5. Metabolism is an example of -- law of thermodynamics. (a) Zeroth
- 6. If a gas expand isothermally then: (a)  $\Delta U = 0$
- (b) 1st
- (d) None of these (d) None of these

- (b) O = 07. Cloud formation is an example of:
  - (a) Isothermal process

(b) Adiabatic process

(c) Isobaric process

- (d) Isochoric process
- 8. If W1, W2 and W3 are work done in isothermal, adiabatic and isobaric process respectively as shown in figure below, then

- (a)  $W_1 = W_2 = W_3$
- (b)  $W_1 < W_2 < W_3$
- $W_2 < W_1 < W_3$
- (d)  $W_3 < W_2 < W_1$

- 9. Specific heat of a substance depends upon:
  - (a) Heat added to system and change in temperature
- (b) Amount of substance (d) All of these

- (c) Nature of substance
- 10.  $PV^{\gamma}$  = constant is true for:
  - (a) Isothermal process

(b) Isobaric process

(c) Isochoric process

- (d) Adiabatic process
- 11. For an ideal gas if  $C_v = \frac{5R}{2}$  and  $C_p = \frac{7R}{2}$  then the gas is:
  - (a) Mono atomic
    - (b) Diatomic
- (c) Polyatomic
- (d) None of these

- 12. The value of y for mono atomic gas is:
  - (a) (b)

(c)

(d)

- 13. Which of this is constant in isochoric process?
  - (a) Volume
- (b) Work done
- (c) Entropy
- (d) Internal energy

| Sr.  | 1. | 2. | 3, | 54. | 5. | 6. | 7. | 8. | 9. | 10. | 11. | 12. | 13. |
|------|----|----|----|-----|----|----|----|----|----|-----|-----|-----|-----|
| Ans: | a  | d  | b  | d   | b  | a  | ь  | c  | С  | d   | ь   | a   | a   |

MDCAT PREP BOOK

## HEAT AND THERMODYNAMICS

- 14. The first law of thermodynamics can be stated as:
- (a)  $Q = \Delta U + W$
- (c)  $Q=\Delta U-W$
- (d)  $Q = \Delta U \times W$
- (a) (c) Q=1 15. Two identical gases expand (i) isothermally (ii) adiabatically leothermal process (a) Isothermal process
  - (b) Adiabatic process
- Neither of them (d) Equal in both cases (c) Equal in both cases

  16. What does the constant n represent in the equation of state for an ideal gas PV = nRT?

  Number of atoms in the gas
- (a) Number of atoms in the gas
- (b) Number of moles of the gas
- Number of nucleons (d) Number of molecules of gas 17. Which of the following is not an assumption of the kinetic model of an ideal gas?
- Particles collide elastically
  - Kinetic energy of a given particle is same
- (b) The duration of collision between molecules is very short
- Intermolecular potential energy of the molecules is zero
- 18. Which of this is constant in adiabatic process
  - (a) Total heat

- (b) Entropy
- Work done (d) Both a and c
- 10 If the system goes from two different paths to same final state, then change in internal energy for both systems is
  - (a) Same

- (b) Different (d) Not enough information
- (c) May be same 20. When heat is given to isobaric process then:

  - (a) Work is done by the gas (b) Internal energy of gas decrease (c) Both a and b
- (d) None of them 21. A monatomic gas at pressure P and Volume V expands isothermally to volume 2V and then adiabatically to volume 16V. The final pressure is:  $(r = \frac{5}{2})$
- (b) 64 P
- (c) 32P
- (d) P/64

- 22. Internal energy of an ideal as depends upon
  - (a) Pressure
- (b) Volume
- (c) temperature

(c) 600J

- (d) all
- 23. Slope of adiabatic(ks) and isothermal(kt) curve related as: (a)  $K_s = \gamma kt$ 
  - - (b) Ks=kt/v
- (c) ks=kt
- (d) ks=2kt

(d) 300J

- 24. What is the internal energy change in system that has absorbed 800J of heat and work done is (a) 1300J (b) 550J
- 25. In SONAR we use:

  - (a) Water waves

- (c) Ultrasound waves
- (b) Sound waves (d) Ultraviolet rays
- 26. In thermodynamics first law is related with (a) Pressure conservation
- (c) Temperature conservation 27. Temperature is defined by
- (b) Entropy conservation (d) Energy conservation
- (a) First law of thermodynamics
- Zeroth law of thermodynamics
- Second law of thermodynamics (d) Third law of thermodynamics
- 28. Which one of the following is not the unit of heat?
- (c) Watt.sec
  - (d) Watt
- 29. If a system undergoes a cyclic process then: (b) Q=0=W 14. 15. 16. 17. 18. 19. 20. a b b

d

- (c)  $\Delta U = 0$ 22.
- (d) W=0

At a certain distance from a point charge the electric field is 500 V/m and the potential is 3000 V.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 14. Consider two point charges of equal magnitude and opposite sign separated by a certain distance. The neutral point due to them:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| What is this distance:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Four capacitance between A and B and between A and C will be:

potential at the centre of the sphere is:

UNIT 06

Zayan Publish

10. A hollow metal sphere of the sphere is:

10. A hollow metal at the centre of the sphere is:

(a) 0V (d) 20 V

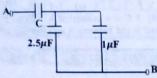

11. Four capacitors of each of capacity 3 F are connected as shown in the figure. The ratio of

(c) 5 V

21. The equivalent capacitance between A and B in the figure is  $1\mu$ F. Then the value of capacitance C is:

- (a)  $1.4\mu F$
- (b) 2.5µF
- (c) 3.5µF
- (d) 1.2µF
- 22. Two point particles, in with charge 8 x 10.9 C and the other with charge -2 x 10.9 C, are separated by 4 m. The electric field in N C midway between them is:
- (b) 36 x 10⁻⁹
- (c) Zero
- 23. The correct expression for electric potential at a distance r due a point charge Q is:
  - (a)  $V = \frac{kQ}{Q}$
- (b)  $V = \frac{kE}{}$

- 24. A charge of 0.01 C accelerated through potential difference of 1000 V acquires K.E?
- (b) 200 J
- (c) 100 J
- 25. The potential difference between two metal plates is halved and distance between them is doubled, the value of electric field strength between them becomes:
  - (a) Half of the original
    - (c) Double of the original

- (b) Same as original
- (d) One-fourth of the original

- 26. The units of  $\varepsilon_r$  are:
  - (a)  $C^2 N^{-1} m^{-2}$
- (b)  $N C^2 m^{-2}$ 
  - (c) N m² C⁻²
- (d) Unit-less
- 27. The electric field between oppositely charged infinite sheets of plates is given by:
  - (a)  $E = \left(\frac{\sigma}{2s}\right)$
- (b)  $E = \left(\frac{2\sigma}{\epsilon}\right)$
- (c)  $E = \left(\frac{\sigma}{\epsilon}\right)$
- (d) Zero
- 28. The potential gradient between the two charged plates having separation of 0.5 cm and potential difference of 12 volt is:
  - (a) 240 N C-1
- (b) 2.4 N C⁻¹
- (c) 24 N C-1
- (d) 2400 N C-1
- 29. The capacity of parallel plate capacitor is 5  $\mu$ F. When a glass plate is placed between the plates of the condenser, its potential difference reduces to  $\frac{1}{r}$  of the original value. The value of dielectric constant of glass is:
- (b) 10 . (c) 5 (d) 40
- 30. By placing the dielectric between the plates of an isolated charged capacitor, the energy stored: (c) Becomes zero
  - (d) Decreases

- (a) Remains same (b) Increases 31. The quantity  $\frac{1}{2} \varepsilon_0 \varepsilon_r E^2$  has significance of:
  - (a) Energy / capacitance

(b) Energy / volume

(c) Energy / coulomb

- (d) Energy / volt
- 32. Three capacitors of capacitance 2  $\mu$ F each are connected in series to a power supply of 6 volt. The voltage across each capacitor is:
- (b) 3 V
- (c) 2 V
- (d) 6 V
- 33. If applied voltage to a capacitor becomes half then capacitance becomes:
  - (a) Double
- (b) Half
- (c) Four time
- (d) Remains same

- 34. A capacitors may be considered as a device for:
  - (a) Storing electrical energy
- (b) Decreasing resistance

(c) Increasing resistance

(d) Storing Chemical energy

NMDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

#### **FLECTROSTATICS**

- (c)  $U = \frac{1}{2} \varepsilon_0 \varepsilon_t E$

- (a)  $U = \frac{1}{2} \varepsilon_0 \varepsilon_r E^2$ 36. The electronic flashguns in cameras is an application of:
- (a) Coulomb's law

- (b) Capacitor
- (d) Diode
- (c) Gauss's law 17. Three objects are brought close to each other, two at a time, when objects A and B are brought Three objects A and B are brought together, they repel. When objects B and C are brought together, they also repel. Which of the following are true?
  - (a) Objects A and C possess charges of the same sign, but not B
  - (b) Objects A and C possess charges of opposite sign
  - (c) All three objects possess charges of the same sign
  - (d) One objet neutral

## 38. Negative of potential gradient is equal to

- (a) Electric intensity (b) Electric flux
- intensity
- (d) Magnetic flux
- 39. A 18.0 V battery is connected to a capacitor, resulting in 27.0  $\mu$ C of charge stored on the capacitor. How much energy is stored in the capacitor?
  - (a)  $2.43 \times 10^{-4}$

(b)  $2.86 \times 10^{-4}$ 

(c)  $2.43 \times 10^{-2}$ 

- (d)  $2.86 \times 10^{-2}I$
- An You have three capacitors, each of 2µC. In which of the following combinations of the three capacitors, the resultant capacitance is 3µC?
  - (a) All three capacitors in series
  - Two capacitors are in series, one in parallel
  - (c) Two capacitors are in parallel, one in series
  - (d) All three capacitors in parallel
- 41. Which one is the correct statement about selenium?
  - (a) Selenium is a good conductor
  - (b) Selenium is a good insulator
  - (c) Selenium is an insulator in the dark and becomes conductor when exposed to light
  - (d) Selenium is an conductor in the dark and becomes insulator when exposed to light
- 42. What is the formula for Coulomb's law?
- (a)  $F = kq_1q_2/r^2$
- (b)  $F = 2kq_1q_2/r^3$
- (c)  $F = kq_1/r$
- (d)  $F = kq_1/q_2$

- 43. Electric potential energy per unit charge is

  - (a) Electric flux
    - (b) Electric potential (c) Electric field
- (d) Electric intensity
- 44. If a particle have charge q is accelerated through a potential difference V., then energy acquired by the particle is: (a)  $Vq^2$
- 45. Electric intensity and electric potential are related as:
  - (a) Electric field intensity is equal to the negative of the gradient of electric potential
  - (b) Electric field intensity is equal to the gradient of electric potential
  - (c) Electric field intensity is equal to the square of the gradient of electric potential
- (d) Electric field intensity is equal to the twice of the gradient of electric potential 46. A capacitor stores 5.3×10⁻⁵ C of charge when connected to a 6.0 V battery. How much charge does the capacitor store when connected to a 9.0-V battery?
  - (a) 79.5 µC
    - (b) 35.3 μC
- (c) 79.5 pC
- (d) 35.3 pC

(a) never cross each other

- (b) Can cross each other
- (c) Depends on shape of charge
- (d) Not enough information
- (c) Depends on snape of charge  $2\mu C$  and mass 2 g moving through electric field strength 20N/C?
  - (a)  $4 \text{ cm/s}^2$
- (b) 2 cm/s²
- (c)  $40 \text{ cm/s}^2$
- (d)  $20 \text{ cm/s}^2$
- 49. Two point charges attract each other with an electric force of magnitude F. If the charge on one of the particles is reduced to one half its original value and the distance between the particles is doubled, what is the resulting magnitude of the electric force between them?
  - (a) F
- (b) F/2

- 50. Electric charge on an object is measured as 5 micro coulombs. How the value of this charge can be expressed in terms of base units:
  - (a) 5 x 100 ampere second

(b) 5 x 10⁺⁶ coulomb second

(c) 5 x 10⁻⁶ ampere second

(d) 5 x 100 coulomb second

### PRACTICE TEST NO. 2

- 1. The electric potential at any point in an electric field can be defined as:
  - (a) Work done in bringing a unit positive charge from infinity to that point
  - (b) Work done in bringing a unit positive charge from infinity to that point while keeping the charge in equilibrium.
  - (c) Work done in bringing a unit negative charge from infinity to that point while keeping the charge in equilibrium.
  - (d) Work done in bringing a unit negative charge from infinity to that point while keeping the charge in equilibrium
- 2. The number of electrons taken out from a body to produce 1 coulomb of charge will be:
  - (a)  $6.25 \times 10^{18}$
- (b)  $625 \times 10^{18}$
- (c)  $6.023 \times 10^{23}$
- 3. An electron is held within electric field. What happens when electron is released?
  - (a) It moves in the direction of electric field
  - (b) It accelerates in the direction of electric field
  - (c) It moves in the direction opposite to electric field
  - (d) It accelerates in the direction opposite to electric field
- 4. A capacitor of capacitance C is connected with resistance R. The time constant of the circuit of the circuit would be:.....
  - (a) RC
- (c) e^RC
- (d) R+C
- 5. The electric potential difference between two points A and B in an electric field can be defined as:
  - (a) Work done in carrying a unit positive charge from infinity to B while keeping the charge in equilibrium
  - (b) Work done in carrying a unit positive charge from A to infinity while keeping the charge in equilibrium
  - Work done in carrying a unit positive charge from A to B while keeping the charge in
  - (d) Work done in carrying a unit positive charge from A to B
- 6. 1 microvolt is:
  - (a)  $1x10^{-3} V$
- (b) 1x10⁴ V
- (c) 1x10⁻⁵ V
- (d) 1x10⁻⁶ V

Zayan Publishe

- You have three capacitors and a battery, in which of the following combinations of the three You have three capacitors is the maximum possible energy stored when the combination is attached to the battery? In parallel (b) In series

  - Either way because both combination have the same capacitance
  - We cannot determine, because presence of resistance in the circuit determines capacitance
- (d) We cannot three capacitors, each of 2µC. In which of the following combination of the three capacitors, the resultant capacitance is maximum?
- (a) All three capacitors in series Two capacitors are in series, one in parallel
- Two capacitors are in parallel, one in series
- (d) All three capacitors in parallel
- 9. Electric field lines provide information about:
- (a) Field strength

(b) Direction

(c) Nature of charge

- (d) All of these
- 10. If two point charges of charge q1 and q2 are placed at distance d. The force between them is proportional to: ......
  - (b)  $q_1 q_2$ (a)  $q_1 + q_2$
- (c) q1/q2
- (d)  $q_1 \times q_2$
- 11. Two point charges are at the distance d. If force between these two charges is F, then what is the force between charges when the distance between them is 3d?

- 12. A test charge of 23 µC is at a point P where an external electric field is directed to the left and has a magnitude of 3.1 × 106 N/C. If the test charge is replaced with another test charge of  $13\mu C$ . What happens to the external electric field at P?
  - (a) It remain same
  - (b) It reverse direction
  - (c) It change in a way that cannot be determined
  - (d) 3.1 × 105 N/C
- 13. The minimum charge on an object cannot be less than:
  - (a) 1.6×10-19C (c) 9.1×10-31C

- (b) 9×109C (d) 1.6×10-27C
- 14.  $\frac{1}{C_{eq}} = \frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3} + \cdots + \frac{1}{C_n}$  is the combination in
- (a) Series (b) Parallel
- (c) Both of them
- 15. You have three capacitor, each of  $2\mu C$ . In which of the following combinations of the three
- capacitor, the resultant capacitance is  $6\mu C$ ? (a) All three capacitors in series
- Two capacitors are in series, one in parallel
- Two capacitors are in parallel, one in series 16. Electric field lines due to a positive charge are: ...
  - (d) All three capacitors in parallel
  - (a) Always horizontal
- (b) Always vertical
- (c) Radially towards the charge 17. The potentials of the two plates of a capacitor are +12.5 V and -12.5 V. The charge on one of the plates is 60 C. The capacitance of the capacitor is:
  - - (b) 3.5 F
- (c) 4.2 F
- (d) 1.7 F

- (a) Be fully charged in 1 second by current of 1 ampere
- (b) Store 5 coulomb of charge at potential difference of 1 volt
- (c) Gain 1 joule of energy when 1 coulomb of charge is stored on it
- (d) Discharge in 1 s when connected across a resistor of resistance 2 ohm
- 19. The automobile wind shield wipers works on the principle of
  - (a) Electricity

- (b) Battery
- (c) Charging and discharging of capacitor
- (d) Charging and discharging of inductor
- 20. 100 V potential difference is applied across the plates of 1  $\mu$ F capacitor. What is the energy stored capacitor?
  - (a) 0.5 mJ
- (b) 5 mJ
- (c) 0.05 mJ
- (d) 50 mJ
- 21. A capacitor acts as blocking elements when applied signal is:
- (b) Sinusoidal
- (c) D.C
- (d) All of these
- 22. When two capacitors of same capacitance are connected in parallel and then in series (same battery is connected across combination in both cases), the energy stored:
  - (a) Is greater for series combination
- (b) Is greater for parallel combination
  - (c) Is same for both combination
  - (d) Is double in series combination than parallel combination
- 23. A glass plate is put within the plates of a charged parallel plate condenser. Which of the following quantities does not change?
- (a) Energy stored (b) Charge (c) Electric intensity (d) Capacity
- 24. A 4 µF capacitor is charged to 400 V and then its plates are joined through a resistance of 2k0 The heat produced in the resistance is:
- (a) 1.28 J (b) 0.64 J (c) 0.32 J 25. The work done in moving a charge along an equipotential surface is:
  - (a) Depends on the path taken (b) Equal to zero

(c) Greater than zero

- (d) Negative
- 26. The force on proton in electric field of magnitude 106 N C1 is:
  - (a) 1.6 x 10⁻¹⁵ N
- (b)  $1.6 \times 10^{-13} \text{ N}$  (c)  $1.6 \times 10^9 \text{ N}$
- (d) 1.6 x 10¹³ N
- 27. An alpha particle has twice the charge of a proton. Two protons separated by a distance 'd' exert a force 'F' on each other. What must be the separation between two alpha particles so that they also exert a force 'F' on each other?

- (b)  $\sqrt{2}d$  (c) d/2 (d)  $d/\sqrt{2}$
- 28. The work done on a unit positive charge while moving it from infinity to a point in electric field keeping the charge in equilibrium is called:
  - (a) Electric potential

(b) Potential difference

(c) Electric field intensity

- (d) Electric force
- 29. The equipotential lines are always to field line:
  - (a) Parallel
- (b) Anti-parallel (c) Perpendicular (d) Inclined at 60°
- 30. The electric field at a certain distance from an isolated alpha particle is 3.0 x 107 N C1. What is the force on an electron when placed at that distance from the alpha particle? (a)  $4.8 \times 10^{-12} \text{ N}$  (b)  $3.0 \times 10^7 \text{ N}$  (c)  $2.6 \times 10^{12} \text{ N}$  (d)  $6.0 \times 10^2 \text{ N}$

- 31. The ratio of the electric force between two protons to that between two electrons separated by same distance is of the order of: (c) 10³⁹ (d) 1
  - (a)  $10^{42}$
- (b) 10³⁶

MDCAT PREP BOOK

By AZHAR IQBAL 0336-7098894

#### **ELECTROSTATICS**

- 32. What is true about electric field lines: (a) No two lines can cross each other
  - Lines are closer where field is weak
  - Tangent to field line gives direction of electric field
  - Both A and C
- (d) Both A and S hown in the adjoining figure, the equivalent capacity between A and B will  $6\mu F$

(a)  $10 \, \mu F$ 

- (c) 15 µF
- (d) 1.2 uF
- 34. Two capacitor of capacity of 0.3 µF and 0.6 µF respectively are connected in series. The combination is connected across a potential of 6V. The ratio of energies stored by the capacitors will be:
- (b) 2 (c)  $\frac{1}{4}$

- 35. A capacitor is used to store 24 watt hour of energy at 1200 V. What should be the capacitance of capacitor?
  - (a) 120 mF
- (b) 120 uF
- (c) 24 µF
- (d) 24 mF
- 36. The true statement is, on increasing the distance between the plates of a parallel plate capacitor:
  - (a) Electric intensity between the plates of capacitor will increase
  - (b) Electric intensity between the plates of capacitor will decrease
  - (c) Electric intensity between the plates of capacitor will remain unchanged
  - (d) The P.D between the plates will decrease
- 37. An α-particle is accelerated through a potential difference of 200 V. The increase in its K.E is:
  - (a) 100 eV
- (b) 200 eV
- (c) 800 eV
- 38. Electric field intensity at a point in between two parallel sheets with like charges of same surface charge densities is:
- (b)  $\frac{\sigma}{\varepsilon_o}$  (c)  $\frac{2\sigma}{\varepsilon_o}$
- 39. An electron enters between two horizontal plates separated by 2mm and having a potential difference of 1000 V. The force on electron is:
  - (a) 8x10⁻¹² N
- - (b) 8x10⁻¹⁴ N
- (c) 8x10° N
- (d) 8x10⁻¹⁴ N
- 40. Two positive charge of 20 C and Q coulomb are situated at a distance of 60 cm. The neutral point between them is at a distance of 20 cm form the 20 C charge. Charge Q is:
- (b) 40 C
- (c) 60 C
- 41. The charges on two sphere are  $+7\mu C$  and  $-5\mu C$  resectivly. They experience a force F. If each of them is given and additional charge of -2  $\mu$ C, the new force of attraction will be:
  - (a) F
- (b) 2F

(b) 1:2

(c) 4:1

- 42. Two capacitors of equal capacity are first connected in parallel and then in series. The ratio of the total capacities in the two cases will be:

| 52. | 33. | 34. | 35 | 36 | 37 3 | 8 39 | 40. | 41. |
|-----|-----|-----|----|----|------|------|-----|-----|

AT PREP BOOK

43. The capacity of a parallel plate condenser is C. Its capacity when the separation between the plates is halved will be:

(a) 4 C

(b) 2 C

(c) C/2

44. The capacity of a parallel plate condenser if  $5\mu$ F. When a glass plate is placed between the plates of the conductor, its potential becomes 1/8th of the original value. The value of dielectric constant

(a) 1.6

(b) 5

(d) 40

45. Electric field strength due to a point charge of 5  $\mu$ C at a distance of 80 cm from the charge is:

(a) 8 x 10⁴ N/C

(b) 7 x 104 N/C

(c) 5 x 10⁴ N/C

(d) 4 x 10⁴ N/C 46. A charge of 5 C is given a displacement of 0.5 m. The work done in the process if 10 J. The potential difference between the two points will be:

(a) 2 V

(a) 10⁴²

(b) 0.25 V

(c) 1 V

(d) 25 V

47. The unit of electric field is not equivalent to:

(a) N/C

(b) J/C

(c) V/m

(d) J/C-m

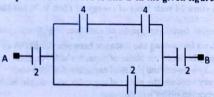

48. When the distance between charged particles become halved the force between them becomes: (a) One-fourth (b) Half (c) Double (d) Four times

49. Fg and Fe represents gravitational and electrostatic force respectively between electrons situated at a distance 10 cm. The ratio of Fg/Fe is of the order of:

(b) 10

(d) 10⁻⁴³

50. What is the equivalent capacitance between A and B in the given figure?

(b) 5 F

(c) 4/5 F

## PRACTICE TEST NO. 3

+2C and +6C charges are repelling each other with a force of 12 N. If each charge is given -2C of charge, then the value of the force will be:

(a) 4 N (attractive) (b) 4N (repulsive) (c) 8N (repulsive) (d) Zero

**FLECTROSTATICS** 

Dielectric constant for metal is:

(b) Infinite

(d) Greater than 1

(a) Zero (a) Connected as shown in figure. Then the

equivalent capacitance between A and B is:

(b) 3C

(c) C/3

(d) 3C/2

4. The electric field near a conducting surface having a uniform surface charge  $\sigma$  density is given

(a) and is parallel to the surface

 $\frac{\sigma}{2s}$  and is parallel to the surface

(c)  $\frac{\sigma}{}$  and is normal to the surface

(d)  $\frac{\sigma}{2\varepsilon}$  and is normal to the surface

5. An alpha particle is accelerated through a potential difference of 106 volt. Its kinetic energy will

(a) 1 MeV

(b) 2 MeV

(c) 4 MeV

(d) MeV

6. What is the potential energy of the two equal positive point charge of 1 µC each held 1 m apart in

(a)  $9 \times 10^{-3} \text{ J}$ 

(b) 9 x 10⁻³ eV

(c) 2eV/m

(d) Zero

7. Figure shows three points A, B and C in a region of uniform electric field E. If VA, VB and VC represents the electric potential at points A, B and C respectively, then:

(a)  $V_A = V_B = V_C$ 

(b)  $V_A = V_B > V_C$ 

(c)  $V_A = V_B < V_C$ 

(d)  $V_A > V_B = V_C$ 

8. Two capacitances of capacity C1 and C2 are connected in series and potential difference V is applied across it. Then the potential difference across C1 will be:

(a)  $V^{\frac{c_2}{2}}$ 

(b)  $V^{\underline{c_1}+\underline{c_2}}$ 

9. A body has - 80 micro coulomb of charge. Number of additional electrons in it will be:

10. A particle 'A' has charge +q and a particle 'B' has charge +4q with each of them having the same (b) 5x10¹⁴ mass m. When allowed to fall from rest through the same electric potential difference, the ratio of their speed  $\frac{v_a}{v_b}$  will become:

(a) 2:1

(c) 1:4

II. When a proton is accelerated through IV, then its K.E will be:

| Sr. 1   | (0) | 164 |    | (c) | 13.6 | ev | (  | d) 1.6 | X 10 |   |
